Re: In-Situ Soil Characterization and Soil Reuse Guidance
Ella Grasso Technical High School
189 Fort Hill Road
Groton, Connecticut

Dear Mr. Tovey:

ATC Group Services LLC (ATC) has prepared the following In-Situ Soil Characterization and Soil Reuse Determination letter report for the parcel known as Ella Grasso Technical High School, located at 189 Fort Hill Road in Groton, Connecticut ("Property"), on behalf of the State of Connecticut Department of Administrative Services (DAS) Division of Construction Services (DCS) ("Client"). A Site Location Map is presented as **Figure 1**.

The purpose of the investigation was to characterize "stockpiled" soils, which according to Mr. Dennis Tovey of the State of Connecticut DAS, DCS, are to be excavated for the construction of a new athletic field. The proposed location for the new athletic field had previously been filled and graded with soils considered excess from demolition of the former technical high school, which was razed in 2019/2020. In order to make a determination if soils are considered acceptable for unrestricted reuse, ATC completed an in-situ soil characterization investigation which is documented below. The results of this investigation have been used to determine if the soils slated for excavation are suitable for reuse without restriction or will require special handling upon excavation in accordance with State regulations.

Environmental Regulations and Reuse Guidance

The Remediation Standard Regulations ("RSRs," Sections 22a-133k-1 through 22a-133k-3 of the Regulations of Connecticut State Agencies) apply to any action taken to remediate polluted soil, surface water or groundwater plume emanating from a release area provided such action is required pursuant to Chapter 445 or Chapter 446 of the Connecticut General Statutes, or is taken pursuant to Public Act 95-183 (Transfer Act) and Public Act 95-190 (Remediation of Contaminated Real Property). The RSRs do not directly apply to the Property due to the lack of any current regulatory requirements. However, the RSRs are used for comparison purposes to determine how to characterize and manage polluted soils.

The RSRs define two criteria that apply to soil: the Direct Exposure Criteria (DEC) and the Pollutant Mobility Criteria (PMC). Direct Exposure Criteria (DEC) apply to soils from grade to 15 feet below the ground surface (fbgs). The DEC are risk-based standards that were developed to be protective of human health. The DEC are subdivided into the Residential DEC (RDEC), which is appropriate for residential properties, and Industrial/Commercial DEC (I/C-DEC), which is appropriate for industrial and commercial properties.

The PMC are used to evaluate the leachability of contaminants in soil. These risk-based standards were developed to be protective of the groundwater by ensuring that the potential for leaching of the contaminants from impacted soils into groundwater is minimized.

The PMC are subdivided into GAPMC and GBPMC, based on the groundwater classification of a site. According to Connecticut Environmental Conditions Online (CTECO), the Property is located in a designated "GA" area by the Connecticut Department of Energy and Environmental Protection (CTDEEP) for groundwater quality area. The "GA" designation indicates the ground water is considered "natural quality" and deemed suitable for drinking without treatment. Connecticut State regulations are the most stringent for "GA" classified groundwater. The PMC are applicable for soils from grade to the seasonal low water table (GAPMC) or above the seasonal high water table (GBPMC), as appropriate based on the CTDEEP groundwater classification.

The RSRs define four (4) categories of soil (Line items #1, #2, #4 and #5) and the CTDEEP General Permit for Contaminated Soil and/or Sediment Management, Staging and Transfer (expired 2018) defines one category of soil {Line item #3} with respect to reuse when excavated:

1. Hazardous waste - The treatment, storage, disposal and transportation of hazardous waste must be done in accordance with Federal and State hazardous waste regulations.

2. Special waste - Special waste is polluted soil that is specially authorized to be disposed of by the CTDEEP. Examples of a special waste include (1) water treatment, sewage treatment or industrial sludges, liquid, solids and contained gases; fly-ash and casting sands or slag; and contaminated dredge spoils; (2) scrap tires; (3) bulky waste; (4) asbestos; (5) residue; and (6) biomedical waste.

3. Contaminated Soil - Contaminated Soil is treated or untreated soil affected by a known or suspected release and determined, or reasonably expected to contain substances at concentrations above the RDEC or GAPMC.

4. Polluted soil – Polluted soil is defined as soils affected by a release of a substance at a concentration above applicable laboratory reporting limit but meets applicable RDEC and GA PMC and; therefore, can be reused on-site or at another site if accepted by the property owner and not placed below the water table or in an area susceptible to erosion.

5. Natural soil - Natural soils are defined as soils which do not contain concentrations of non-native contaminants above applicable laboratory reporting limits. Natural soils may be used at any parcel if the soils meet this criterion.

Environmental Investigation

The environmental investigation was conducted in an area of "stockpiling" with the location based upon the *Grasso Technical High School - Additional Excess Material Placement Map* dated 06/23/2020 and completed by Richter & Cegan Inc. This map depicts an area approximately 570 feet in length and 260 feet in width.

Prior to the investigation, ATC contacted Call Before You Dig (CBYD), a public utility locating service, to locate and mark subsurface public utilities entering the Property. In addition, ATC marked out proposed soil boring locations and contracted with a Ground Penetrating Radar (GPR) subcontractor, Underground

Surveying LLC located in Brookfield, Connecticut, to conduct a GPR survey of each drilling location. The GPR unit was used to clear proposed drilling locations of subsurface utilities and other obstructions such as large boulders placed during stockpiling activities. ATC marked out the boring locations across the fill area in an approximate 100 foot grid prior to the survey. Based upon the results of the GPR survey, the boring locations were either shifted or considered to be clear for drilling.

On December 1, 2020, ATC contracted with Glacier Drilling of Durham, Connecticut to advance 20 soil borings (B-1 through B-20) throughout the fill area. The borings were advanced using direct-push Geoprobe® drill rig equipped with macrocore samplers lined with disposable acetate sleeves for collection of soil samples. These 20 soil borings were set at approximately 100 feet apart. On December 2, 2020, ATC added an additional six (6) soil borings (B-21 through B-26) to reduce a portion of grid to 50 feet apart for better delineation.

The borings were advanced to a depth of 12 feet below ground surface (fbgs) with the exception of borings B-24, B-25, and B-26, which were located on the shallow western slope at an elevation approximately four (4) feet lower than the 23 other borings. These borings were advanced to a terminal depth of only eight (8) fbgs. Boring locations are presented on **Figure 2**. Soil samples were collected at four (4) foot depth intervals from each boring. A total of 71 soil samples were collected. The 0-4 foot soil sample was identified as "A", the 4-8 foot soil sample was identified as "B" and the 8-12 foot soil sample (if collected) was identified as "C".

Soil samples collected during the investigation were field screened utilizing a photo-ionization detector (PID). The PID measures the total concentration of volatile organic compounds (VOCs) within a specific ionization range in the sample headspace, but does not measure the actual concentrations of individual compounds that may be present. A portion of the soil sample was transferred from the sampling device into a re-sealable plastic bag. The sample was allowed to equilibrate approximately 15 minutes prior to screening. The plastic bag was opened approximately one half-inch to allow for insertion of the PID probe. No significant PID responses were noted in the sample containers.

Soil samples were collected into the appropriate laboratory sample containers, placed in an ice-packed cooler, and transported to Phoenix Environmental Laboratories, Inc. of Manchester, Connecticut (Phoenix), a State of Connecticut certified laboratory, under chain of custody protocols. Based on the results presented in the Remedial Action and UST Removal Report prepared by ATC and dated June 23, 2020, soil samples were analyzed by one or more of the following analyses:

- Extractable Total Petroleum Hydrocarbons(ETPH) by the CTDEEP approved method;
- VOCs in accordance with United States Environmental Protection Agency (USEPA) Method 8260;
- Polycyclic aromatic hydrocarbons (PAHs) in accordance with USEPA Method 8270; and,
- Total Resource Conservation and Recovery Act (RCRA) 8 metals and if necessary based on concentrations, SPLP RCRA 8 metals.

Soil samples collected from soil borings B-24 and B-25 were placed on hold until initial sampling results were received. Based on the results, further delineation was not required, and therefore, these soil samples were not analyzed.

Based on soil samples collected, soils in the fill area were identified as medium to fine brown to gray sand and gravel with a layer of topsoil within the first foot layer. Groundwater and bedrock were not encountered during advancement of borings to 12 fbgs. Boring B-1 did encounter refusal at 9 fbgs which in all likelihood was a boulder placed during stockpiling activities. Trace asphalt and brick fragments were noted in soil borings B-8 and B-9.

Soil Analytical Results

Copies of the Laboratory Certificates of Analysis and Chains of Custody for the investigation are included in **Attachment A**. **Table 1** presents the results of the soil analysis along with the sampling depths and compares them to the applicable RSR criteria. The overall analytical results from the soil investigation are reported below:

VOCs
For screening purposes, 30 of the original 60 soil samples (B-1 through B-20 {A,B,C}) collected as part of the proposed scope of work were analyzed for VOCs. VOCs were not detected above the laboratory reporting limit in the 30 soil samples submitted. Based on these results ATC concluded that additional analysis of the remaining 41 samples was not warranted for VOCs.

ETPH
The original 60 soil samples (B-1 through B-20 {A,B,C}) collected as part of the proposed scope of work were analyzed for ETPH. ETPH was detected above the laboratory reported limit in only one (1) soil sample. The 0-4 foot sample from B-13A had an ETPH concentration of 390 milligrams per Kilogram (mg/Kg). The concentration does not exceed the applicable RSR criteria. Based on these results ATC concluded that additional analysis of the remaining 11 samples was not warranted for ETPH.

Total RCRA 8 Metals
For screening purposes, 30 of the original 60 soil samples (B-1 through B-20 {A,B,C}) collected as part of the proposed scope of work were analyzed for total RCRA 8 metals. One or more RCRA 8 metal was noted in all soil samples submitted for analysis. The concentrations did not exceed the applicable RSR criteria and the level of concentrations noted are considered to be background or native concentrations. Based on these results, ATC concluded that additional analysis of the remaining 41 samples was not warranted for VOCs.

PAHs
Seventy one (71) soil samples were analyzed for PAHs. One or more PAHs were detected above the laboratory reporting limit in 10 of the 71 samples analyzed. One soil sample, B-4C, had several PAH concentrations that exceeded applicable RSR criteria.

Overall, detections of contaminants of concern (COCs) were noted above the laboratory reporting limit in soil samples from 10 soil borings. One (1) sample, B-4C, contained COCs that exceeded the applicable RSR criteria.

Soil Reuse Determination

Figure 2 depicts the delineation of soil areas that are considered to impacted (COCs greater than the laboratory reporting limit or background). Three (3) separate impacted zones were identified as shown on **Figure 2** and are listed as Impacted Zone #1, Impacted Zone #2, and Impacted Zone #3.

Polluted Soil is defined as soils affected by a release of a substance at a concentration above applicable laboratory reporting limit but meets applicable RDEC and GA PMC. Soil from Impacted Zone #1 and Impacted Zone #2 meets the definition of Polluted Soil.

Contaminated Soil is treated or untreated soil affected by a known or suspected release and determined, or reasonably expected to contain substances at concentrations above the RDEC or GAPMC. Soil from Impacted Zone #3 meets the definition of Contaminated Soil.

Based on the sampling grid and location of soil samples, ATC prepared cross-sections (**Figures 3 through 5**) at specific horizontal line distances (stations) that are shown **Figure 2**. Each cross-section then depicts the soil samples that were being deemed polluted or contaminated and the determination of the area of impact though interpretation. The areas of impacts are calculated by dividing the area into simple figures (triangles and trapezoids) and computing the area by length and depth. Then the volumes were calculated using the average end area of two (2) separate cross sections which are considered to be related and multiplying by the distance between the cross-sections.

The calculated volumes of each impacted zone is presented below:

Impacted Zone #1 = 6,334 cubic yards (yd^3)
Impacted Zone #2 = 2,095 yd^3
Impacted Zone #3 = 412 yd^3

Based upon ATCs findings, soils excavated within Impacted Zone #1 and #2 are deemed polluted and can be reused onsite or offsite, with approval by the offsite property owner, if deemed suitable as fill material and not placed below the water table and not placed in an area susceptible to erosion. If these criteria cannot be met, then then the soils will need to be transported offsite for disposal.

Soils excavated within Impacted Zone #3 are deemed contaminated and it is recommend that this material be disposed of off-site at a facility permitted to accept such waste. Alternatively, this soil maybe be reused in other scenarios, such as beneath a building or other permanent structure, beneath four feet of clean fill (or two feet of clean fill beneath a paved surface) or beneath a paved surface. This material should not be placed below the water table.

The remaining balance of the stockpile that is excavated and not within the impacted zones may be reused without restriction.

If you have any questions, please do not hesitate to contact the undersigned.

Sincerely,

Abbreviations and Symbols
ND<0.24 = not detected above the laboratory reoirting limit
mg/kg = milligrams per kilogram
NA = Not Analyzed
NE = Criteria Not Established
GAPMC = GA Pollutant Mobility Criteria
ICDEC = Industrial Commercial Direct Exposure Criteria
RES DEC = Residential Direct Exposure Criteria
ETPH = Extractable Total Petroleum Hydrocarbons
CTDEEP = Connecticut Department of Energy and Evironmental Protection
RSRs = Remediation Standard Regulations
* = Criteria taken from CTDEEP table entitled " Recommended Criteria Values for Common Additional Polluting Substances and Alternate Criteria " dated November 2015.

Notes:
1) Concentrations shown in **bold** were reported above the laboratory reporting limits for the specified compound
2) Concentrations shown in **bold & shaded** were above the laboratory reporting limits & CTDEEP RSR Criteria

Abbreviations and Symbols
ND<0.24 = not detected above the laboratory reoirting limit
mg/kg = milligrams per kilogram
NA = Not Analyzed
NE = Criteria Not Established
GAPMC = GA Pollutant Mobility Criteria
ICDEC = Industrial Commercial Direct Exposure Criteria
RES DEC = Residential Direct Exposure Criteria
ETPH = Extractable Total Petroleum Hydrocarbons
CTDEEP = Connecticut Department of Energy and Evironmental Protection
RSRs = Remediation Standard Regulations
* = Criteria taken from CTDEEP table entitled " Recommended Criteria Values for Common Additional Polluting Substances and Alternate Criteria " dated November 2015.

Notes:
1) Concentrations shown in **bold** were reported above the laboratory reporting limits for the specified compound
2) Concentrations shown in **bold & shaded** were above the laboratory reporting limits & CTDEEP RSR Criteria

Sample ID#s: CH23802 - CH23861

This laboratory is in compliance with the NELAC requirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory. This report is incomplete unless all pages indicated in the pagination at the bottom of the page are included.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200. The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Sincerely yours,

Phyllis Shiller
Laboratory Director

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

RL/PQL=Reporting/Practical Quantitation Level ND=Not Detected BRL=Below Reporting Level
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.

Comments:

TPH Comment:
**Petroleum hydrocarbon chromatogram contains a multicomponent hydrocarbon distribution in the range of C14 to C36. The sample was quantitated against a C9-C36 alkane hydrocarbon standard.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

Volatile Comment:
There was a suppression of the last internal standard in the low level analysis, all affected compounds are reported from the methanol preserved high level analysis which did not exhibit this interference.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

RL/PQL=Reporting/Practical Quantitation Level ND=Not Detected BRL=Below Reporting Level
QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

QA/QC Surrogates: Surrogates are compounds (preceeded with a %) added by the lab to determine analysis efficiency. Surrogate results(%) listed in the report are not "detected" compounds.

Comments:

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200.
The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Comment:

Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

l = This parameter is outside laboratory LCS/LCSD specified recovery limits.
m = This parameter is outside laboratory MS/MSD specified recovery limits.
r = This parameter is outside laboratory RPD specified recovery limits.

QA/QC Data

Sample Criteria Exceedances Report

GCH23802 - ATC-EH

SampNo	Acode	Phoenix Analyte	Criteria	Result	RL	Criteria	RL Criteria	Analysis Units

*** No Data to Display ***

Phoenix Laboratories does not assume responsibility for the data contained in this exceedance report. It is provided as an additional tool to identify requested criteria exceedences. All efforts are made to ensure the accuracy of the data (obtained from appropriate agencies). A lack of exceedence information does not necessarily suggest conformance to the criteria. It is ultimately the site professional's responsibility to determine appropriate compliance.

REASONABLE CONFIDENCE PROTOCOL
LABORATORY ANALYSIS QA/QC CERTIFICATION FORM

Laboratory Name: Phoenix Environmental Labs, Inc. ***Client:*** ATC Associates

Project Location: GRASSO TECH ***Project Number:***

Laboratory Sample ID(s): CH23802-CH23861 ***Sampling Date(s):*** 12/1/2020, 12/2/2020

List RCP Methods Used (e.g., 8260, 8270, et cetera) 6010, 7470/7471, 8260, 8270, ETPH

1	**For each analytical method referenced in this laboratory report package, were all specified QA/QC performance criteria followed, including the requirement to explain any criteria falling outside of acceptable guidelines, as specified in the CT DEP method-specific Reasonable Confidence Protocol documents?**	☑ Yes ☐ No
1A	**Were the method specified preservation and holding time requirements met?**	☑ Yes ☐ No
1B	***VPH and EPH methods only:*** **Was the VPH or EPH method conducted without significant modifications (see section 11.3 of respective RCP methods)**	☐ Yes ☐ No ☑ NA
2	**Were all samples received by the laboratory in a condition consistent with that described on the associated Chain-of-Custody document(s)?**	☑ Yes ☐ No
3	**Were samples received at an appropriate temperature (< 6 Degrees C)?**	☑ Yes ☐ No ☐ NA
4	**Were all QA/QC performance criteria specified in the Reasonable Confidence Protocol documents acheived? See Sections: ETPH Narration, VOA Narration.**	☐ Yes ☑ No
5	**a) Were reporting limits specified or referenced on the chain-of-custody?** **b) Were these reporting limits met?**	☐ Yes ☑ No ☑ Yes ☐ No
6	**For each analytical method referenced in this laboratory report package, were results reported for all constituents identified in the method-specific analyte lists presented in the Reasonable Confidence Protocol documents?**	☐ Yes ☑ No
7	**Are project-specific matrix spikes and laboratory duplicates included in the data set?**	☑ Yes ☐ No

Notes: For all questions to which the response was "No" (with the exception of question #7), additional information must be provided in an attached narrative. If the answer to question #1, #1A or 1B is "No", the data package does not meet the requirements for "Reasonable Confidence". This form may not be altered and all questions must be answered.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete.

RCP Certification Report

December 09, 2020

SDG I.D.: GCH23802

SDG Comments

Metals Analysis:
The client requested a shorter list of elements than the 6010 RCP list. Only the RCRA 8 Metals are reported as requested on the chain of custody.

8270 Semi-volatile Organics:
The client requested a short list for 8270 RCP Semivolatile. Only the PAH constituents are reported as requested on the chain-of-custody.

ETPH Narration

Were all QA/QC performance criteria specified in the Reasonable Confidence Protocol documents achieved? No.

QC Batch 555162 (Samples: CH23838, CH23839, CH23840, CH23841, CH23842, CH23843, CH23844, CH23845, CH23846, CH23847, CH23848, CH23849, CH23850, CH23851, CH23852, CH23853, CH23854, CH23855, CH23856): -----

The MS/MSD RPD exceeds the method criteria for one or more analytes, therefore there may be variability in the reported result. (Ext. Petroleum H.C. (C9-C36))

The MS/MSD RPD exceeds the method criteria for one or more surrogates, therefore there may be variability in the reported result. (% n-Pentacosane)

Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

Batch 555274 (CH23297) CHEM26 12/2/2020-2

CH23836(1X), CH23837(1X), CH23841(1X), CH23842(1X), CH23843(1X), CH23847(1X), CH23848(1X), CH23849(1X), CH23853(1X), CH23854(1X), CH23855(1X), CH23859(1X), CH23860(1X), CH23861(1X)

All LCS recoveries were within 70 - 130 with the following exceptions: None.
All LCSD recoveries were within 70 - 130 with the following exceptions: None.
All LCS/LCSD RPDs were less than 30% with the following exceptions: None.
The MSD is not reported for this LL soil batch.
Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

Batch 555286 (CH23158) CHEM03 12/2/2020-2

CH23823(1X), CH23824(1X), CH23829(1X), CH23830(1X), CH23831(1X), CH23835(1X)

All LCS recoveries were within 70 - 130 with the following exceptions: Acetone(68%), Carbon tetrachloride(132%), Dichlorodifluoromethane(138%)
All LCSD recoveries were within 70 - 130 with the following exceptions: Dichlorodifluoromethane(140%), trans-1,4-dichloro-2-butene(132%)
All LCS/LCSD RPDs were less than 30% with the following exceptions: None.
Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

Batch 555461H (CH23341) CHEM14 12/3/2020-1

CH23847(50X)

All LCS recoveries were within 70 - 130 with the following exceptions: None.
All LCSD recoveries were within 70 - 130 with the following exceptions: None.

RCP Certification Report

December 09, 2020

SDG I.D.: GCH23802

VOA Narration

All LCS/LCSD RPDs were less than 30% with the following exceptions: None.
Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

QC (Site Specific):

Batch 555449 (CH23825) CHEM26 12/3/2020-1

CH23825(1X)

All LCS recoveries were within 70 - 130 with the following exceptions: None.
All LCSD recoveries were within 70 - 130 with the following exceptions: None.
All LCS/LCSD RPDs were less than 30% with the following exceptions: None.
All MS recoveries were within 70 - 130 with the following exceptions: None.
All MSD recoveries were within 70 - 130 with the following exceptions: None.
All MS/MSD RPDs were less than 30% with the following exceptions: None.
Additional 8260 criteria: 10% of LCS/LCSD compounds can be outside of acceptance criteria as long as recovery is 40-160%, 25-160% for Chloroethane-HL and Trichlorofluoromethane-HL.

Temperature Narration

The samples were received at 3.2C with cooling initiated.
(Note acceptance criteria for relevant matrices is above freezing up to 6°C)

Sample ID#s: CH28599 - CH28609

This laboratory is in compliance with the NELAC requirements of procedures used except where indicated.

This report contains results for the parameters tested, under the sampling conditions described on the Chain Of Custody, as received by the laboratory. This report is incomplete unless all pages indicated in the pagination at the bottom of the page are included.

All soils, solids and sludges are reported on a dry weight basis unless otherwise noted in the sample comments.

A scanned version of the COC form accompanies the analytical report and is an exact duplicate of the original.

If you are the client above and have any questions concerning this testing, please do not hesitate to contact Phoenix Client Services at ext.200. The contents of this report cannot be discussed with anyone other than the client listed above without their written consent.

Sincerely yours,

Phyllis Shiller
Laboratory Director

Re: Geotechnical Study for Proposed New Buildings at Ella T. Grasso Technical Vocational School, 189 Fort Hill Road, Groton, CT; Revisions Section 5.0.2; Section 6.0 and Section 6.1 50% Review of Documents

Dear Richard:

1.0 Data from the test borings taken at the above referenced site have been previously forwarded. Ten preliminary borings were drilled in October 2015 at possible future areas of development areas, five of which were in proximity to the proposed building footprint. The preliminary borings were drilled to a maximum depth of 30.3 feet below the existing grades. Water level observation wells were installed in two of those borings. The boring program for the subject study, which includes borings B-17 thru B-23 around the west end of the existing structure and borings B-24 thru B-54 at the proposed new school building. These latter borings (B-24 thru B-55) were drilled to a maximum depth 27 feet below existing grade. Much of area in the west 60% of the proposed building footprint was filled to depths as deep as 26 feet, with soil from on site excavation during the 1973 construction. The boring locations are shown on the attached plan. The borings were located from existing topography. Water table readings at four monitor wells are included with the boring data. *The borings were drilled by Clarence Welti Associates, Inc. and sampling was conducted by this firm solely to obtain indications of subsurface conditions as part of a geotechnical exploration program. No services were performed by Dr. Clarence Welti, P.E., P.C. to evaluate subsurface environmental conditions.*

1.1 Included with the boring data are six geologic sections through the proposed building. The bottom of fill is defined partially by the old (pre 1973) topography and the recent boring data.

2.0 The **Subject School Building** will have two ground floor levels, based on the existing hillside topography. The upper level (about 60,000 sf on the east side) will have a ground floor at Elev. 82 and the lower level (about 80,000 sf on the west side) will have a ground floor at Elev.66. Additional proposed structures include **(1) The Bus Garage**, which overlies the existing building and has proposed footprint of about 15,000 sf and **(2) The Field House** with a footprint of about

2,400 sf. The latter two structures would be built in phase 2 and would be covered in a separate report.

2.0.1 The existing topography on the east side of the school building ranges from about Elev. 80 to Elev. 77 with existing fill depths up to 16 feet but averaging less than 5 feet over 50% of this section.

2.0.2 The existing topography on the west side of the building ranges from Elev. 77 to about Elev. 62. The bottom of the existing fill at the west wall of the building is as deep as Elev. 40. Some areas with new fill could be up to 28 feet above the original natural (pre-1973) grades.

3.0 The **Geologic Origin** of the natural inorganic soils is from glacial moraine deposits. These deposits consist generally of dense to very dense fine to medium sand with little to some silt, gravel and cobbles. There is existing fill in west area of the proposed school building extending up to 26± feet below the existing grades. The fill materials consist generally of materials which were excavated from the east portion of the school site during the 1973 construction. The bedrock, based on geologic mapping, is granitic Mamacoke Formation interlayered Gneiss.

3.1 The **Soils/Rock Cross Section** from the borings is generally as follows:

East 60,000 sf Area of Building (see borings B-5, B-6, B-30, B-31, B-34, B-35, B-37, B-38, B-40, B-41, B-43A, B-44, B-44A, B46, B-47, B-47A, B-50 and B-51)

Bituminous Concrete to 3" to 4"; or Topsoil to 8" to 10"

Underlay of Pavement; fine to coarse SAND, some Gravel, trace Silt 9" to 12"

FILL; fine to medium SAND, some Silt, little Gravel to 1 to 10 feet below grade (lowest at Elev. 67), loose to dense

Moraine; fine to medium SAND, some Silt, little Gravel to auger refusal at 3 to 28+ feet (Elev. 53 to Elev.76), medium compact to very dense

The ground water was between Elev. 61 and Elev. 73 at the completion of the borings

West 80,000sf Area of Building (see borings B-4, B-25, B28, B-29, B-30A, B32, B32A, B-33, B-33A, B-36, B-39, B-40, B-42, B-43, B-45, B-46, B-48, B-49, B-52 thru B-54, B-54A)

Bituminous Concrete 3" to 4"; or Topsoil to 4" to 10"

Underlay of Pavement; fine to coarse SAND, some Gravel, trace Silt 9" to 12"

FILL; fine to medium SAND, some Silt, trave to little Gravel, trace Roots to 7 to 26 feet (Elev.36 to Elev. 67), loose to medium compact

Moraine; fine to medium SAND, some Silt, trace to little Gravel to auger refusal at 12 to 27+ feet (Elev.<35 to Elev. 64), medium compact to very dense

The ground water was Elev. 35 to Elev. 70 at the completion of the borings

3.3 The **Groundwater** in the building area appears to be primarily related to the origin pre-1973 topography. Typically the springtime water tables in moraine soils would be within 5 feet of grade in terrain where there is less than a 10% grade. The moraine soils have low permeabilities and a low voids ratios. These properties allow the water table to temporarily mound in areas from storm water recharge. Most of the building footprint has some fill and the water table is either at the base of the fill or possibly 1 to 2 feet into the base of fill.

4.0 The **Criteria for Foundation Type and Loading** are as follows:

1. The maximum total settlement shall not exceed 3/4" and the maximum differential settlement shall not exceed ½ the maximum settlement.

2. The foundation type and structure must address seismic requirements of the building code.

3. The slab at grade floors shall not settle in excess of ½" relative to the main structure.

These criteria are generally applied to buildings of similar character to the subject structure. If the owner, the architect, the engineers find the criteria as unacceptable, the writer should be informed to permit additional geotechnical input.

4.1 Regarding item 2 (above), the seismic site soil profile classification is 'C'. The mapped MCE Spectral Response Acceleration values for Groton, CT are as follows: For short periods S_S= 0.160 and for one second periods S_1 = 0.058.

5.0 Regarding **Foundation Type,** the natural soil/rock profile at the site has a relatively high bearing capacity. While the design can be based on spread footings, the variation in the soils cross sections (as noted on the attached cross sections) requires site specific treatment beneath the spread footings and floor slabs in areas where there are existing fills.

5.0.1 The east section of the building (floor at Elev. 82) will have spread footings generally on the natural moraine at least 3feet below original natural grades. Some areas could have footings on compacted structural fill after removal of any existing fill and subsoils to at least 2 feet below original natural grade. The natural soils will be sensitive to remolding beneath equipment when wet. To address this condition there should be a minimum 6" layer of 3/8" crushed stone on a geotextile placed beneath footings on the natural soils and as an initial layer beneath controlled fills where atop a wet subgrade. The **allowable bearing pressure** at least 3 feet into the natural moraine and on structural fills less than 3 feet thick could be 3 Tons/sf.

5.0.2 The west section of the building (floor at Elev. 66), as noted in section 3.1 above and on the geologic cross sections, has up to 26 feet of silty moraine fill from prior construction, which was

erratically compacted. The requirement for a structural support on the silty moraine fill from prior 1973 construction would have had to include kneading compaction in layers not exceeding 8" to properly break up chunks of soil. Based on the erratic soil sample blow counts in the borings, this was obviously not the case. While some areas may indicate sample blow counts in the borings as being suitable for spread footing support, the borings are spaced at about 100 feet apart and it would be clearly inappropriate to interpolate or extrapolate data from uncontrolled and uncertified fills. The recommended support of building foundations and the slab on grade in this area of the building is with drilled or driven aggregate piers. With the floor at Elev. 66, interior spread footings at about Elev.63 and the exterior wall footings at about Elev.62., the top of the aggregate piers would be at about Elev. 62. The layout and design of the piers would be by a design build contractor. The bottom of the fill in the cross sections is defined from pre-1973 topography and also from the recent boring data. In establishing the bottom, these two sources may vary since the old topography may not always be accurate or the low blow count on the samples near the bottom of the fill could actually be in loose subsoil which were below the original natural ground. **In establishing the bottom of the fill for pier lengths the lowest indicated bottom should be used**. Normal spread footings would be placed on a 12" layer of crushed 3/4"stone over the piers with an **allowable bearing pressure of 2 Tons/sf.** Regarding the slab on grade the aggregate pier placement does provide fill improvement, which would permit a normal slab on grade, based on sub-grade modulus of at least 150 pci. A more conservative design of the slab on grade could be done, assuming that the slab loading on the piers at 3+ feet below the slab will be distributed at least 2 feet out from the piers. With 24" Dia. piers this would indicate square area about 3'x 3' which would be spanned as a reinforced slab.

5.1 The retaining wall at intersection of the two floor levels: Design loading on this wall would depend on the timing of backfill on the wall. In any case the wall loading would include both the soil loading and seismic loading. If the wall is backfilled prior to placement of structure above the wall, the loading on the wall could be a combination of active and seismic loading equal to $20H^2$ pounds per foot of wall. From a seismic standpoint there should also be an inertial load equal to the mass of the wall plus the backfill over the heel times 0.07 (½ of assumed A_v). Backfill of the wall should be with material cited in section 6.0 below. The backfill should extend a distance behind the wall equal to the height of the wall to a 1:1 cut into the natural soil.

5.1.1 The allowable bearing pressure for the wall footings can be an average of 3 Tons/sf if at least 3 feet into the natural moraine or on a structural fill less than 3 feet thick. For structural fills exceeding 3 feet in depth the allowable average bearing pressure cab be 2 Tons/sf. The maximum loading on the toe of the footing can be 50% above he average pressure.

5.1.2 There should be footing drain at the base of retaining wall footings to exclude any hydrostatic load on the wall.

5.2 The **ultimate sliding factor for footings** is 0.60.

5.3 The **Frost Protection Depth** in accordance with the Building Code is 3.5 feet below finish grades in areas which are exposed to weather.

5.4 The **Foundation Design Parameters** are summarized as follows:

Design Parameters	Values
Allowable Bearing Pressure on controlled fill in excess of 3 feet	4,000 psf
Allowable bearing Pressure at least 3 feet below top of natural of on structural fill less than 3 feet thick	6000 psf
Frost Protection Depth	3.5 feet
Backfill Unit Weight (Section 6.0)	125 pcf
Angle of Internal Friction (Backfill), φ	34°
At Rest Lateral Coefficient	0.45
Active Lateral Coefficient (level backfill)	0.28
Ultimate Sliding Coefficient, Concrete on crushed stone or controlled fill	0.60
Seismic Design Parameters	
Seismic Site Soil Profile Classification	C
Mapped MCE Spectral Acceleration for Short Periods S_S	0.160
Mapped MCE Spectral Acceleration for On Second Periods S_1	0.058

6.0 Regarding **Controlled Fill, Backfill of Excavations for Footings and Walls, and Fill beneath slab at Grade floors** to within 6" of the slab bottom, the material shall conform to the following gradation or be 3/8" crushed stone:

Percent Passing	Sieve Size
100	3.5"
50 - 100	3/4"
25 - 75	No.4

The fraction, passing the No.4 sieve shall have less than 15%, passing the No. 200 sieve.

All controlled fill and backfill must be compacted to at least 95% of modified optimum density in accordance with ASTM D-1557.

6.0.1 In the east section of the building (area not on aggregate piers) all existing fills should be removed from beneath the floor slab and replaced with controlled fill conforming to section 6.0 above. In the west section of the building (area where the floor slab is supported by the aggregate piers) there should be a minimum 2 feet of controlled fill between the top of the piers and the bottom of the floor slab. A vapor retarder is required below the slabs on grade.

6.1 The 6" immediately beneath the slab on grade should be with 3/4" minus processed stone conforming the following gradation:

Percent Passing	Sieve Size
100	1.25"
90 - 100	1"
75 - 100	3/4"
25 - 60	1/4"
10 - 35	No. 40
3 - 12	No. 100
0 - 5	No. 200

6.1.1 If there is a requirement for Radon mitigation, the above material would be deleted and 3/4" stone would be placed. The depth of the stone would be defined by the designer of the venting system.

7.0. Regarding the **Earthwork** the existing fill area would fall in OSHA Class C. Excavation slope, which are not shored and exceed 5 feet in height, must be cut back to slope of 1.5 Horizontal to 1.0 Vertical The natural on site soil at least3 feet below original grade would fall in OSHA Class B and would require excavation slopes of 1:1 for unshored cuts exceeding 5 feet in height.

7.1 The natural soils may be sensitive to remolding under equipment when wet. If the subgrades are wet, there would be a requirement 12" to 18" initial layer of crushed stone or off site sand and gravel as working surface for ongoing equipment movements.

8.0 This report has been prepared for specific application to the subject project in accordance with generally accepted soil and foundation engineering practices. No other warranty, express or implied, is made. In the event that any changes in the nature, design and location of structures are planned, the conclusions and recommendations contained in this report should not be considered valid unless the changes are reviewed and conclusions of this report modified or verified in writing.

The general recommendations submitted in this report are based in part upon data obtained from referenced explorations. The extent of variations between explorations may not become evident until

construction.

Dr. Clarence Welti, P.E., P.C., shall perform a general review of the final design and specifications in order that geotechnical design recommendations contained in the Geotechnical Report may be properly interpreted and implemented as they were intended.

If you have any questions please call our office.

Very truly yours,

Max Welti, P.E.

Re: Geotechnical Study for Proposed Site Improvements at Ella Grasso Technical Vocational School, 184 Fort Hill Road, Groton, CT; Revisions at section 4.1.4 and Cross Sections at Slope Toward the Brook ; Supplement to Address 50% Drawings + Review of 90% Drawings

Dear Richard:

1.0 Data from borings and test pits taken for the subject project have been previously forwarded with our report of August 31, 2016. Twenty three borings were drilled in areas of proposed site improvements to maximum depth of 25 feet. Nine test pits were taken, with three pit in the proposed building area (TP-1 thru TP-3) and six in areas of site improvements (TP-4 thru TP-9). A separate geotechnical study has been provided for the building, which included 39 borings. These latter boring data provided geologic cross sections, which covered the structure and can be extrapolated into the the lower part of the site. The site borings were drilled to auger refusal, to below any existing fill or to a maximum depth of 20 feet into natural soil. One boring (see B-60A) was cored into the bedrock at the proposed track area. Water level observation wells were placed in four of the building borings (B-5, B-6, B-42 and B-43A) and one site boring (B-73). Water table readings are included with the boring data. *The borings were drilled by Clarence Welti Associates, Inc. and sampling was conducted by this firm solely to obtain indications of subsurface conditions as part of a geotechnical exploration program. No services were performed to evaluate subsurface environmental conditions.*

1.1 Twenty six grain size gradation tests were performed on soils, which are typical of soils, which would be encountered in future excavations or in embankments. The results of those tests are included in the appendix.

2.0 The **Site Work for the Subject Project,** apart from the work beneath the proposed buildings, includes the following:

1. **A new track and field area** at the highest part of the site, partially covering the existing building, which will be demolished. This area is contiguous to the base of slope, where the original swale at the base of the slope has become a wetland. The proposed seating at the field overlies part of the wet swale. The work in this area will be in phase 2 after demolition of the existing structure.

2. **A new road network accessing the buildings and athletic facilities proposed for the site**. These include (a) the relocated entry roadway extending along the north site boundary and cutting into the existing slope to depths up 18± feet to subgrade (See section 4.2.1); (b) the new parking area for buses and passenger vehicles adjacent to the upper building level, which is in a shallow cut on the east side (see sections 4.2.2 and 4.2.3); © the access road along the lower level of the new building with passenger vehicle parking to be constructed on an embankment over a previously placed deep fill (see section 4.3.1); (d) a new roadway adjacent to the west side of the new track (see section 4.2.4) and (e) the peripheral roadway on the south side of the site (see section 4.4).

3. **The new slope on the west side the site:** The slope extends generally from the east bank of the water course at about Elev. 20 up to about Elev. 65 and locally up to Elev. 90. It is presently proposed to have a 2:1 slope without benches. Much of the proposed slope will overlie a previously placed fill slope. The proposed slope will be largely composed of on site excavation. *It is understood that the detention basin indicated at the top of the slope will be eliminated and the depressed area would be filled. This would probably reduce the height of the nearby mound.*

2.1 Regarding soil and rock types, which will be encountered in the proposed site work, the natural soil is dense moraine with a silt content generally in the range of 25 to 35%. The natural water content may be close to, or above the optimum water content. The existing fill materials encountered in the borings and test pits is from excavated moraine soils from the existing buildings and site facilities. This material was irregularly placed and compacted. It has water contents in many areas, which are above the optimum water content. Much of the upper part of the site development will be at the razed existing structure. The east side of the track will encounter rock, which is a relatively sound Gneiss.

3.0 General Geotechnical Issues:

3.1 Summary of Excavation Requirements: The site excavations into the natural soils will be in dense silty moraine, which will in many areas have a water content above the optimum water content and may require temporary stockpiling. This material must be thoroughly kneaded to avoid clumps of soil, which could break down when saturated and cause an unstable condition, possibly affecting pavement stability or slope stability. The requirement for kneading will limit fill lifts to 8" or less. Specific procedures are noted herein, but the contractor must be fully alerted to the possible problems, which can occur without adherence to the recommended procedures.

3.2 OSHA requirements: In areas with existing fill the soils are considered Class C and any excavations, which exceed 5 feet in height and are not shored, must be cut back to slopes not exceeding 1.5 Horizontal to 1.0 Vertical. The natural undisturbed dense moraine would be considered as Class B soil, which would require unshored cuts exceeding 5 feet in height to be cut back to 1:1

3.3 Underlay of drainage and trench backfill: Storm drainage and sanitary piping should have at least 6" of crushed 3/8" stone beneath the piping. The crushed stone at storm drainage should be carried to 3" above the spring line of the pipe. The crushed stone at sanitary lines should be carried to 6" above the pipe. Backfill of piping in areas beneath pavements should be with gravel fill, compacted to at least 95% of modified optimum density. In landscaped areas the backfill can be with on site materials placed and compacted in lifts not exceeding 12". Compaction can be with hoe packs to at least 90% of modified optimum density.

3.4 Material density changes from cuts to fills: (1) Natural moraine shrinkage of zero; (2) Rock swell of 10%; (3) Existing uncontrolled fill shrinkage of 5% into controlled fills**.**

4.0 The conditions and specific requirements for addressing areas of site work, cited in section 2.0 are as follows:

4.0.1 Materials: It is possible that the existing building concrete and bricks would be crushed and used in some of the fill areas (in Phase 2). To avoid issues with these materials becoming crushed during placement and creating a material other than that which was tested in the laboratory, the material must be initially crushed to 1" or finer. Other off site materials, cited in this section, are specified in CTDOT Specification 816.

4.1 Development of track and field, stabilization of the swale and the base of slope contiguous to the track. The area at the toe of the slope had a prior swale, but did not provide stone wedge with under drainage at the slope and the swale apparently did not have positive drainage. The result is effectively a wetland about 8 feet wide at the base of the slope.

4.1.1 The area at the proposed seating and stabilization of the drainage swale will require special treatment as follows: (1) At the base of the 2H:1V slope and 40 feet to the west of the toe of the slope, excavate to 3 feet below proposed grade, (2) Place 15" of crushed 3/8" stone on the base of the cut, (3) Place an under drain at the base of the crushed stone, (4) Place a wedge of crushed 3/4" stone 5 feet (vertically) up the slope atop the 3/8" crushed stone, (5) Fill up to within 6" of the bottom of a paved swale with clean gravel meeting CTDOT Spec 816; Section. M.02.06, grading A, (6) Place processed stone base for the 6" below the paved swale and (7) Pave swale with 3" of bituminous concrete or possibly with precast concrete swale sections.

4.1.2 The proposed field, as shown on the present plans is synthetic turf. The plans indicate the section beneath the turf and fine graded material will have 12" of stone, which is placed over "ordinary fill". It should be noted that (1) part of the field may have rock excavation beneath section; (2) on site material as fill may not be stable to support heavy construction equipment and (3) the section may be subjected to frost action from saturated soil below the stone. It is

recommended that there be at least 8" of Gravel Fill beneath the crushed stone under the synthetic turf to address the above issues.

4.1.3 The underlay of the track and field events area should include at least 16" of gravel subbase conforming to CTDOT 816, Section M.0.2.06 grading A. There should be 6" of processed stone base conforming to CTDOT 616 Section M.05.01. The bituminous concrete should be placed in two courses to 3.5". An edge drain is recommended around the track.

4.2 Roadways and parking areas:

4.2.1 The Relocated North Roadway accessing Bus Queues and Passenger Vehicle Parking at the upper building level and the access to the track and field (see borings B-2, B-73, B-77, B84A and B-84B): The roadway encroaches into existing mounds and slopes at the northeast corner of the site with cuts to sub-grade as deep as 18 feet. One monitor well was placed at boring B-73, which indicated the ground water at about Elev.90 or about 10 feet above the proposed grades. The remaining borings in this area indicated ground water (either from sample water contents or water level in the borings) to be close to proposed pavement subgrades. The proposed slopes are indicated at 2H:1V. This is acceptable with the following conditions: (1) The formation of the cut slope must exclude over excavation and back-blading and (2) there must be stone wedge at the toe of slope to at least 5 feet (vertically) up the slope. The stone wedge shall be tied to an under drain at the pavement edge (or snow shelf). The section beneath the bituminous concrete should include at least 12" of gravel subbase (CTDOT Specification 816 Section M..02.06 Grading A)and 8" of processed stone base (CTDOT Specification 816 Section M.05.01). The pavement sections in this area, which will have combined bus and passenger vehicle traffic, should have at least 4.5" of bituminous concrete, placed in at least two courses.

4.2.2 Bus Queues at Upper Level of building: This area should be treated similar to that in section 4.2.1 above, as regards the pavement section. A under drain should placed at the east edge of the pavement. The heavy duty pavement would apply to bus route around the south end of the classroom building and at the access to the proposed bus garage.

4.2.3 Passenger Vehicle Parking East of Bus Queues: This bituminous concrete thickness in this area should be 3.5". The underlay should include 6" of Processed Stone Base and 12" of gravel subbase. An under drain and stone wedge should be placed at the toe of the cut slope to the east.

4.2.4 Roadway with parking above the slope at the parking area in section 4.2.3: This area is largely within the existing building footprint and close to the existing grades. Fill to the bottom of the pavement section in this area could be with reclaimed crushed concrete. The pavement section should include 3.5" of bituminous concrete, 6" of processed stone base and 8" of gravel subbase.

4.3 The Roadway with Parking at the lower level of the building:

4.3.1 This roadway (apart from the parking) will have bus traffic and possibly occasional heavy truck traffic and should have a bituminous concrete similar to the roadway cited section 4.2.1 above. Much of this area will be on a fill, up to 15 feet in height (Elev. 50 to Elev. 65). The base of the fill will generally be on previously placed fill. Some the fill surface has collected storm water in the silty soils, resulting in less than stable surficial conditions.

4.3.2 The construction of the embankment in this area will require an initial layer of crushed 3/4" stone on geotextile to at least 18" above the existing stripped sub-grade. The area of this crushed stone should for bidding purposes be assumed to be 60 feet wide x 200 feet in length. This material should be placed on one lift to address the surficially unstable surface. The fill above this initial layer could be with either on site excavation or crushed and reclaimed building materials. The silty moraine must be placed in lifts not exceeding 8" and must be thoroughly kneaded prior to vibratory compaction. If the silty moraine material exceeds the optimum water content, it would be necessary to place intervening layers of crushed concrete or off site gravel fill. Required compaction would be to at least 93% of modified optimum density (ASTM 1557 D).

4.3.3 The pavement section atop the embankment should be as follows: 4.5" of Bituminous Concrete on 8" of Processed Stone Base on 8" of Gravel Subbase.

4.4 Periphery road at south end of site, extending from road on west side of athletic field to connection to main road at the lower part of the site (see borings B-56 thru B-59):

4.4.1 The soils cross section from the above boring data indicate the dense silty moraine described elsewhere herein. The water table on boring completion varied from 4 feet to 14 feet below grade. The soil samples below 7 feet have water contents at or close to saturation**.**

4.4.2 The grading plan indicate cuts of 10+ feet over parts of the proposed roadway, which would place the grades at or close to saturated frost susceptible silty moraine soil. The slope contiguous to the roadway on the high side should have stone wedges and under drains.

4.4.3 The pavement section should include the followings: 3.5" of Bituminous Concrete on 6" of Processed Stone Base over12" of Gravel Subbase.

4.5 Slope from Lower Roadway at about Elev. 65 to the Brook at about Elev.20 (see borings $B\text{-}5_{1973}$ and $B\text{-}6_{1973}$ and test pits TP- 4 thru TP-6).

4.5.1 Much of the proposed slope will be over areas with existing fill, part of which may be saturated and locally loose. The toe of slope as defined by the boring data will be on dense moraine, which will have the water table locally on the surface.

4.5.2 The construction of the slope on the west side of the site should obviously be initiated at the base to address localized anomalies in the natural soil and in the existing uncontrolled fill. The base of the fill in proximity to the brook will require an initial 12" layer of crushed 3/8" stone over a width of about 20 feet. A stone wedge up to 5 feet vertically on the slope should be

placed at the toe of slope. A cross section of this area is shown in appendix 3. The slope on the natural grade up to about Elev. 40 is at 3H±:1V. The part of the fill, which is 10 feet or higher would not require grubbing. The trees could be cut flush and the initial fill lift could be 18". If the ground surface is wet, the initial fill lift should be with off site sand and gravel conforming to the gradation for gravel subbase. The boulders at the base of the slope can be placed in the embankment, where the embankment height exceeds 6 feet. Boulders must be spread apart to permit placement and compaction of the soil between the boulders. It may be necessary to place of off site sand in some areas around the boulders to preclude voids in the embankment. Alternatively the boulders can be crushed before placement in the embankment.

4.5.3 The existing fill slope extends from about Elev.40 to about Elev. 50 to 60, where there was a prior parking area for about a 60 feet width. The grade rises from this level on a 2H:1V slope to about Elev. 65. The sloped area of existing fill will require 8 feet wide benches at 25 feet horizontal spacing with 12" of crushed 3/8" stone on the benches, as noted in the sections in appendix 3.The embankment formation over the flat area from about Elev. 55 to Elev. 65 is discussed in section 4.3 above. This area will have a substantial heavy duty pavement, which does require stringent compaction control of the embankment.

4.5.4 The placement and compaction over the remainder of the slope development should be limited to 8" lifts and compaction should be to at least 93% of modified optimum density with initial kneading compaction of the silty moraine. On site excavation from the natural moraine soils, which do not exceed the optimum water content by more than 3%, may be used as fill. If there evident weaving a 12" layer of 3/4" crushed stone or gravel subbase conforming to CTDOT 816, Section M.0.2.06 grading A, would be required to permit additional filling.

4.6 Backfill at Catch Basins and Manhole in paved areas have experienced significant heaving, which appears to be related to frost penetration into fines within the backfill. It is possible that carefully placed backfill in small lift can avoid this problem. The alternative would be to allow at least 12" of crushed 3/8" stone around the structures.

4.7 Sidewalks*:* The concrete sidewalks should have at least 8" of Gravel Base (M.02.06, grading C) beneath the concrete.

5.0 This report has been prepared for specific application to the subject project in accordance with generally accepted soil and foundation engineering practices. No other warranty, express or implied, is made. In the event that any changes in the nature, design and location of structures are planned, the conclusions and recommendations contained in this report should not be considered valid unless the changes are reviewed and conclusions of this report modified or verified in writing.

The analyses and recommendations submitted in this report are based in part upon data obtained from referenced explorations. The extent of variations between explorations may not become evident until construction. If variations then appear evident, it will be necessary to re-evaluate the recommendations of this report.
Dr. Clarence Welti, P.E., P.C., should perform a general review of the final design and specifications in order that geotechnical design recommendations may be properly interpreted and implemented as they were intended.

If you have any questions please call me.

Very truly yours,

Max Welti, P.E.

Re: Proposed Grasso Tech School, Delineation of Building Area Requiring Aggregate Pier Support for Foundations and Floor Slabs

Dear Rich:

Attached is the plan defining the proposed easterly limit of the aggregate piers. The westerly limit is 5 feet west of the west wall of the building.

The limit line is defined as follows: starting from the south wall at a point 5 feet west of Line J, then extending on a line parallel to and 5 feet west of line J north to a point 8 feet north of Line 4A, then parallel and easterly on a line 8 feet north of line 4A to a line 5 feet west of Line CA, then parallel to and 5 feet west of Line CA, to the north end of the building.

The location of the line is based on boring interpolation and the original site topography. Most of the area east of the line will be at or below the original topography. Some footings will require up to 3± feet of structural fill in the area east of the designated line.

If you have any questions, please call me.

Very truly yours,

Clarence Welti, PhD, P. E.

Re: Grasso Technical High School, Groton, CT; Geotechnical Study for Proposed Reconstruction of Athletic Fields in Southwest Area of Site (West of Fort Hill Brook)

Dear Richard:

1.0 The applicable boring data from the 2013 borings at the subject site were B-11, B-12 and B14 thru B-16. The data from these borings with the boring location plan are in the Appendix. *The borings were drilled by Clarence Welti Associates, Inc. and sampling was conducted by this firm solely to obtain indications of subsurface conditions as part of a geotechnical exploration program. No services were performed to evaluate subsurface environmental conditions.*

2.0 The **Subject Project** includes new baseball and softball fields plus drainage improvements. The major considerations are related to achieving all weather athletic fields in an area that is understood to have a potential for flooding. The fields are proposed to be under drained. A small toilet building and two parking lots are also proposed. One of the parking lots would have a gravel surface and the other would have an asphalt surface.

2.1 Topographically the site is relatively flat with existing grades between Elev. 10 and Elev. 13. The indicated proposed grades are generally within a foot of the existing grades.

3.0 The **Geologic origin** of the natural soils is generally from glacial lake deposits. These deposits consist generally of stratified sands with little silt and gravel to 16+ feet below grade. The site been filled over substantial parts of the area with excess material from the excavation at the original buildings and parking areas.

3.1 The **Soils Cross Section** from the borings is generally as follows:

Topsoil to 7" to 10"

FILL; fine to medium SAND, little to some Silt, little Gravel, trace Roots and Wood to 3 to 7

feet, loose to dense

Locally; fine to medium SAND and SILT, trace Roots and Wood to about 3 feet below FILL, medium compact

Fine to coarse SAND, little Silt, little Gravel to 16+ feet, medium compact

3.2 The **Water Table** was evident at 4 to 8 feet below the existing grades at the completion of the borings. These water table readings were in the fall season and may not be representative spring season water tables. In general the soil up to 2 feet above the hydrostatic water level are saturated from capillary water. The area drains into Fort Hill Brook, which empties into Mumford Cove. FEMA mapping of the area indicates that portions of the proposed athletic fields are in a FEMA AE flood zone with the base flood at Elev.10.

4.0 The **Performance Criteria for Proposed Athletic Fields are assumed as follows**

1. Following a rainfall of 3" of precipitation per day the field should be playable within 2 days.

2.Within 2 days following recession of flooding of the field the ground water should be no higher than within 18" of the playing surface and the field surface should be playable with ground water at 18" or more below the field grades.

5.0 The above criteria will require at least 24" of well drained sand or sand and gravel with permeability of at least 40 feet/day plus under drainage at 30 feet on centers**.** It is assumed that the field outside the infield would have 11" to 12" of topsoil and subsoil atop the drainage layer. The bottom of the drainage layer should be sufficiently high in elevation to be free draining after heavy rains or backwater flooding.

6.0 At the baseball field the applicable borings B-14 thru B-16 indicate about 10" of topsoil atop fills with variable silt content. In general these soils would not meet the required permeability cited in section 5.0 above. The water table in boring B-16 was at 5 feet below grade with saturated soils probably within 3 feet of grade. The bottom of Fort Hill Brook immediately east of the baseball field is at Elev. 5 to Elev. + 6, which indicates the water table in the area within 30 to 40 feet of the brook is probably 2 to 3 feet above the brook bottom in dry season and rainy seasons could be 4 to 5 feet above the brook level or Elev. 10 to Elev. 11. The gradient on the brook is very flat with a substantial upland watershed, which results in irregular peaks in the brook levels. The indicated proposed grading would have the under drain inverts as low as Elev. 10.

6.1 Based on the assumed performance criteria, particularly the water table level in proximity to playing field grade, the field should probably be raised at least 1 to 1.5 feet above the existing grades. By raising the grade, the amount of excavation and disposal of existing soils could be reduced. If the field can not be raised due to FEMA limitations, the alternative to raising the grade would be a pumping system for the under drainage.

7.0 Regarding the softball field (Boring B-11) the soils consist of 7 feet of fill with silt contents in excess of 30 %. The water table at the boring was within 4 feet of grade. The recommendation on raising the proposed grade, as cited for the baseball field would also apply here.

8.0 Regarding the proposed parking for buses and passenger vehicles, the initial preparation should include stripping of topsoil and subsoil. If the sub-grade is stable, place and compact 18" of gravel sub-base conforming to CTDOT Specification 817 Section M.02.06 Grading A in two lifts. If the sub-grade is saturated the initial lift should be with a minimum 10" layer of 3/4" crushed stone on a geotextile (Mirafi RS380i or equal) and a 9" layer of gravel subbase would be placed over the crushed stone. The surface course should be with 6" of 3/4" minus processed base conforming to the following gradation:

Percent Passing	Sieve Size
100	1.25"
90 - 100	1"
75 - 100	3/4"
10 - 35	1/4"
3 - 12	No. 100
0 - 5	No 200

The gravel subbase and processed stone base should be compacted to at least 95% of modified density (ASTM 1557D).

The bituminous concrete thickness should be 3.5".

9.0 Regarding the proposed structure the floor level is shown on the plan as Elev11.5 and the existing grades appear to be between about Elev. 11 and Elev.11. It is recommended that the floor level and surrounding grades be raised by 1 to 2 feet, if possible . All topsoil should be stripped and there should be at least 2 feet of gravel subbase beneath building floor to address frost and areal flooding. Footings should be on the natural soils or on a controlled fill placed after the removal of any existing fills and organic soils. There should be a minimum 6" layer of 3/4" crushed stone on a geotextile beneath footings on the natural soils and as an initial layer beneath controlled fills where atop a wet sub grade. The footings should be at least 3.5 feet below finished exterior grades for frost protection. The allowable bearing pressure can be 2,000 psf.

10.0 This report has been prepared for specific application to the subject project in accordance with generally accepted soil and foundation engineering practices. No other warranty, express or implied, is made. In the event that any changes in the nature, design and location of structures are planned, the conclusions and recommendations contained in this report should not be considered valid unless

the changes are reviewed and conclusions of this report modified or verified in writing.

The analyses and recommendations submitted in this report are based in part upon data obtained from referenced explorations. The extent of variations between explorations may not become evident until construction. If variations then appear evident, it will be necessary to re-evaluate the recommendations of this report.

Welti Geotechnical, P.C., should perform a general review of the final design and specifications in order that geotechnical design recommendations may be properly interpreted and implemented as they were intended.

If you have any questions please call me.

Very truly yours,

Clarence Welti, Ph.D., P.E.
Vice President, Welti Geotechnical, P.C.

c: Herbert May, P. E. hmay@macchiengineers.com

UTILITY NOTES:

1. ALL UTILITIES SHALL BE INSTALLED IN ACCORDANCE WITH EACH UTILITY COMPANY'S REGULATIONS. CONTRACTOR SHALL COORDINATE ALL WORK WITH THE RESPECTIVE UTILITY COMPANY (TOWN OF GROTON, EVERSOURCE, FRONTIER, ETC.)
2. UTILITY INFORMATION SHOWN IS TAKEN FROM UTILITY MAPS AND LIMITED FIELD INFORMATION. CONTRACTOR IS RESPONSIBLE FOR FINAL VERIFICATION OF UTILITY LOCATIONS AFFECTING THE PROPOSED WORK AND ANY ASSOCIATED FIELD MODIFICATIONS. TEST PITS ARE REQUIRED AND SHALL BE INCLUDED . ANY MODIFICATION TO THE WORK OUTLINED IN THESE PLANS OR THE PROJECT SPECIFICATIONS SHALL BE TO THE SATISFACTION OF THE ENGINEER.
3. THE SITE CONTRACTOR SHALL PROVIDE ALL PLUMBING CONNECTION APPURTENANCES, (FITTINGS, REDUCERS, ENLARGERS, WYES, TEES, ETC.) AS REQUIRED TO MAKE THE NECESSARY CONNECTIONS. REFER TO BUILDING PLUMBING PLANS FOR ADDITIONAL UTILITY INFORMATION.
4. SITE ELECTRICAL AND LIGHTING IS SHOWN FOR REFERENCE ONLY. REFER TO ELECTRICAL PLANS, DETAILS, AND SPECIFICATIONS FOR ADDITIONAL INFORMATION.
5. CONTACT CALL BEFORE YOU DIG (811) AT LEAST 48 HOURS PRIOR TO START OF CONSTRUCTION AND AS EACH UTILITY IS TO BE INSTALLED. IN THE EVENT CALL BEFORE YOU DIG IS UNABLE TO LOCATE THE UTILITIES IT SHALL BE THE CONTRACTORS REASONABILITY TO HIRE A PRIVATE UTILITY LOCATING COMPANY AT NO COST TO THE OWNER.
6. ALL EXISTING MANHOLE FRAMES AND COVERS, UTILITY BOXES AND VALVE COVERS SHALL BE ADJUSTED TO FINAL GRADE AS REQUIRED.
7. ALL EXISTING UTILITIES SYSTEMS SHALL REMAIN IN OPERATION UNTIL NEW STORM DRAINAGE SYSTEM HAS BEEN INSTALLED.

GRADING NOTES:

1. PROVIDE POSITIVE DRAINAGE AWAY FROM FACE OF ALL BUILDINGS
2. PRIOR TO COMMENCING EXCAVATION WORK, THE CONTRACTOR SHALL NOTIFY ALL UTILITY COMPANIES IN ACCORDANCE WITH "DIG SAFE" NOTIFICATION PROCEDURES PROMOTED BY RESPECTIVE UTILITY COMPANIES.
3. THE CONTRACTOR SHALL BLEND NEW EARTHWORK SMOOTHLY INTO EXISTING EARTHWORK.
4. CONTRACTOR SHALL VERIFY ALL EXISTING GRADES IN THE FIELD AND REPORT ANY DISCREPANCIES IMMEDIATELY TO THE COLLEGE'S REPRESENTATIVE PRIOR TO STARTING WORK.
5. ANY AREA OUTSIDE THE LIMIT OF WORK THAT IS DISTURBED SHALL BE RESTORED TO ITS ORIGINAL CONDITION AT NO COST TO THE OWNER.
6. PITCH EVENLY BETWEEN SPOT GRADES. ALL PAVED AREAS MUST PITCH TO DRAIN AT A MINIMUM OF ONE-EIGHTH INCH (1/8") PER FOOT.
7. WHERE NEW PAVING MEETS EXISTING PAVING, MEET LINE AND GRADE OF EXISTING WITH NEW ONE.
8. EXCAVATION REQUIRED WITHIN PROXIMITY OF EXISTING UTILITY LINES SHALL BE DONE BY HAND. THE CONTRACTOR SHALL REPAIR ANY DAMAGE TO EXISTING UTILITY LINES OF STRUCTURE INCURRED DURING CONSTRUCTION OPERATIONS AT NO COST TO THE OWNER.
9. ALL PROPOSED TOP OF CURB ELEVATIONS ARE SIX INCHES (6") ABOVE BOTTOM OF CURB UNLESS SHOWN OTHERWISE.

Federal Emergency Management Agency

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The Construction Documents, consisting of Drawings, Specifications, and general provisions of the Contract, including Division 00 General and Supplementary Conditions and other Division 01 Specification Sections, are complimentary; they include and apply to this Section

1.2 SUMMARY

A. This Section includes administrative and procedural requirements required for compliance with the International Building Code, Chapter 17, Structural Tests and Special Inspections.

B. Structural testing and special inspection services are required to verify compliance with requirements specified or indicated. These services do not relieve contractor of responsibility for compliance with other construction document requirements.

1. Specific quality-assurance and -control requirements for individual construction activities are specified in the Sections that specify those activities. Requirements in those Sections may also cover production of standard products.

2. Specified tests, inspections, and related actions do not limit Contractor's other quality-assurance and -control procedures that facilitate compliance with the construction document requirements.

3. Requirements for contractor to provide quality-assurance and -control services required by architect, owner, or authorities having jurisdiction are not limited by provisions of this section.

C. The owner will engage one or more qualified special inspectors and / or testing agencies to conduct structural tests and special inspections specified in this section and related sections and as maybe specified in other divisions of these specifications.

D. Related Sections include but are not limited to the following:

1. Division 3 Section “Cast-In-Place Concrete.”

2. Division 4 Section “Unit Masonry Assemblies.”

3. Division 5 Section “Structural Steel”

4. Division 6 Section “Timber Trusses”

5. Division 6 Section “Rough Carpentry”

6. Division 31 Section “Earthwork.”

1.3 DEFINITIONS

A. Approved Agency: An established and recognized agency regularly engaged in conducting tests or furnishing inspection services when such agency has been approved by the building official.

B. Construction Documents: Written, graphic and pictorial documents prepared or assembled for describing the design, location and physical characteristics of the elements of a project necessary for obtaining a building permit. Construction Documents include all supplemental instructions, sketches, addenda, and revisions to the drawings and specifications issued by the registered design professional beyond those issued for a building permit.

C. Shop Drawings / Submittal Data: Written, graphic and pictorial documents prepared and / or assembled by the contractor based on the Construction Documents.

D. Structural Observation: Visual observation of the structural system by a representative of the registered design professional’s office for general conformance to the approved construction documents. Structural observations are not considered part of the structural tests and special inspections and do not replace inspections and testing by the testing agency or special inspector.

E. Special Inspector: A qualified person who demonstrating competence, to the satisfaction of the code enforcement official and registered design professional in responsible charge, for inspection of the type of construction or operation requiring special inspection. The special inspector shall be a licensed professional engineer or engineering intern or a qualified representative from the testing agency.

F. Special Inspection, Continuous: The full-time observation of work requiring special inspection by an approved special inspector who is present in the area where the work is being performed.

G. Special Inspection, Periodic: The part-time or intermittent observation of work requiring special inspection by an approved special inspector who is present in the area where the work has been or is being performed and at the completion of the work.

H. Testing Agency: A qualified materials testing laboratory under the responsible charge of a licensed professional engineer, approved by the code enforcement official and the registered design professional in responsible charge, to measure, examine, test, calibrate, or otherwise determine the characteristics or performance of construction materials and verify confirmation with construction documents.

1.4 QUALITY ASSURANCE

A. Testing Agency Qualifications:

1. Minimum qualifications of inspection and testing agencies and their personnel shall comply with ASTM E329-03 Standard Specification for Agencies in the Testing and / or Inspection of Materials Used in Construction.

2. Inspectors and individuals performing tests shall be certified for the work being performed as outlined in the appendix of the ASTM E329. Certification by organizations other than those listed must be submitted to the building official for consideration before proceeding with work.

3. In addition to these requirements, local jurisdiction may have additional requirements. It is the responsibility of the testing and inspection agencies to meet local requirements and comply with local procedures.

1.5 CONFLICTING REQUIREMENTS, REPORTS, AND TEST RESULTS

A. General: If compliance with two or more standards is specified and the standards establish different or conflicting requirements for minimum quantities or quality levels, comply with the most stringent requirement. Refer uncertainties and requirements that are different, but apparently equal, to the registered design professional in responsible charge for a decision before proceeding.

B. Minimum Quantity or Quality Levels: The quantity or quality level shown or specified shall be the minimum provided or performed. The actual installation may comply exactly with the minimum quantity or quality specified, or it may exceed the minimum within reasonable limits. To comply with these requirements, indicated numeric values are minimum or maximum, as appropriate, for the context of requirements. Refer uncertainties to the registered design profession in responsible charge for a decision before proceeding.

C. The special inspector's reports and testing agencies results shall have precedence over reports and test results provided by the contractor.

D. Where a conflict exists between the construction documents and approved shop drawings / submittal data, the construction documents shall govern unless the shop drawings / submittal data are more restrictive. All conflicts shall be brought to the attention of the registered design professional in responsible charge.

1.6 SUBMITTALS BY SPECIAL INSPECTOR AND / OR TESTING AGENCY

A. Special inspectors shall keep and distribute records of inspections. The special inspector shall furnish inspection reports to the building official, and to the registered design professional in responsible charge, contractor, architect, and owner. Reports shall indicate that work inspected was done in conformance to approved construction documents. Discrepancies shall be brought to the immediate attention of the contractor for correction. If the discrepancies are not corrected, the discrepancies shall be brought to the attention of the building official and to the registered design professional in responsible charge prior to the completion of that phase of the work. A final report documenting required special inspections and correction of any discrepancies noted in the inspections shall be submitted at a point in time agreed upon by the permit applicant and the building official prior to the start of work.

1. Special inspection reports and test results shall include, but not be limited to, the following:

a. Date of inspection.

b. Description of inspections or tests performed including location (reference grid lines, floors, elevations, etc.).

c. Statement noting that the work, material, and / or product conforms or does not conform to the construction document requirements.

d. Name and signature of contractor's representative who was notified of work, material, and / or products that do not meet the construction document requirements.

e. Name and signature of special inspector and / or testing agency representative performing the work.

B. Schedule of Non-Compliant Work: Each agent shall maintain a log of work that does not meet the requirements of the construction documents. Include reference to original inspection / test report and subsequent dates of re-inspection / retesting.

C. Reports and tests shall be submitted within 1 week of inspection or test. Schedule of Non-Compliant Work shall be updated daily and submitted at monthly intervals.

D. Final Report of Special Inspections. Submitted by each agent listed in the schedule of Structural Testing and Special Inspections.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 CONTRACTOR'S RESPONSIBILITY

A. The contractor shall coordinate the inspection and testing services with the progress of the work. The contractor shall provide sufficient notice to allow proper scheduling of all personnel. The contractor shall provide safe access for performing inspection and on-site testing.

B. The contractor shall submit schedules to the owner, registered design professionals and testing and inspecting agencies. Schedules will note milestones and durations of time for materials requiring structural tests and special inspections.

C. Each contractor responsible for the construction of a seismic-force-resisting system, designated seismic system, or component listed in the quality assurance plan shall submit a written contractor's statement of responsibility to the building official and to the owner prior to the commencement of work on the system or component. The contractor's statement of responsibility shall contain the following:

1. Acknowledgment of awareness of the special requirements contained in the quality assurance plan.

2. Acknowledgment that control will be exercised to obtain conformance with the construction documents approved by the building official.

3. Procedures for exercising control within the contractor's organization, the method and frequency of reporting and the distribution of the reports.

4. Identification and qualifications of the person(s) exercising such control and their position(s) in the organization.

D. Each contractor responsible for the construction of a main windforce-resisting system or a wind-resisting component listed in the quality assurance plan shall submit a written statement of responsibility to the building official and the owner prior to the commencement of work on the system or component. The contractor's statement of responsibility shall contain the following:

1. Acknowledgment of awareness of the special requirements contained in the quality assurance plan.

2. Acknowledgment that control will be exercised to obtain conformance with the construction documents approved by the building official.

3. Procedures for exercising control within the contractor's organization, the method and frequen-

cy of reporting and the distribution of the reports.

4. Identification and qualifications of the person(s) exercising such control and their position(s) in the organization.

E. The contractor shall repair and / or replace work that does not meet the requirements of the construction documents.

1. Contractor shall engage an engineer / architect to prepare repair and / or replacement procedures.
2. Engineer / architect shall be registered in the state in which the project is located. Engineer shall be acceptable to the registered design professional in responsible charge, code enforcement official, and owner.
3. Procedures shall be submitted for review and acceptance by the registered design professional in responsible charge, code enforcement official, and owner before proceeding with corrective action.

F. The contractor shall be responsible for costs of:

1. Re-testing and re-inspection of materials, work, and / or products that do not meet the requirements of the construction documents and shop drawings / submittal data.
2. Review of proposed repair and / or replacement procedures by the registered design professional in responsible charge and the inspectors and testing agencies.
3. Repair or replacement of work that does not meet the requirements of the construction documents.

3.2 STRUCTURAL OBSERVATIONS

A. Structural observations may be made periodically as determined by the registered design professional in responsible charge.

3.3 TESTING AND INSPECTION

A. Testing and inspection shall be in accordance with the attached Schedule of Special Inspections.

B. Reference related specifications for the minimum level of inspections and testing. Provide additional inspections and testing as necessary to determine compliance with the construction drawings.

3.4 SCHEDULES AND FORMS (ATTACHED)

A. Statement of Special Inspections: Special Inspections will be performed according to the Statement of Special Inspections immediately following this Section.

END OF SECTION 507000

Statement of Special Inspections

Project: ***Grasso Technical High School - Athletic Field Construction***
State Project No. BI-RT-877A

Location: ***189 Fort Hill Road, Groton, CT***

Owner: ***State of Connecticut***

Design Professional in Responsible Charge: ***Macchi Engineers, LLC, Hartford, CT***

This *Statement of Special Inspections* is submitted as a condition for permit issuance in accordance with the Special Inspection and Structural Testing requirements of the Building Code. It includes a schedule of Special Inspection services applicable to this project as well as the name of the Special Inspection Coordinator and the identity of other approved agencies to be retained for conducting these inspections and tests. This *Statement of Special Inspections* encompass the following disciplines:

☒ Structural ☐ Mechanical/Electrical/Plumbing
☐ Architectural ☐ Other: _____

The Special Inspection Coordinator shall keep records of all inspections and shall furnish inspection reports to the Building Official and the Registered Design Professional in Responsible Charge. Discovered discrepancies shall be brought to the immediate attention of the Contractor for correction. If such discrepancies are not corrected, the discrepancies shall be brought to the attention of the Building Official and the Registered Design Professional in Responsible Charge. The Special Inspection program does not relieve the Contractor of his or her responsibilities.

Interim reports shall be submitted to the Building Official and the Registered Design Professional in Responsible Charge.

A *Final Report of Special Inspections* documenting completion of all required Special Inspections, testing and correction of any discrepancies noted in the inspections shall be submitted prior to issuance of a Certificate of Use and Occupancy.

Job site safety and means and methods of construction are solely the responsibility of the Contractor.

Interim Report Frequency: ***Weekly*** or ☐ per attached schedule.

Schedule of Inspection and Testing Agencies

This Statement of Special Inspections / Quality Assurance Plan includes the following building systems:

- ☒ Soils and Foundations
- ☒ Cast-in-Place Concrete
- ☐ Precast Concrete
- ☒ Masonry
- ☒ Structural Steel
- ☐ Cold-Formed Steel Framing
- ☐ Spray Fire Resistant Material
- ☒ Wood Construction
- ☐ Exterior Insulation and Finish System
- ☐ Mechanical & Electrical Systems
- ☐ Architectural Systems
- ☐ Special Cases

Special Inspection Agencies	Firm	Address, Telephone, e-mail
1. **Special Inspection Coordinator**	Macchi Engineers, LLC Michael R. Plickys, P.E. CT No. 17241	44 Gillett Street Hartford, CT 06105 mplickys@macchiengineers.com (860) 549-6190
2. Inspector		
3. Inspector		
4. Testing Agency	TBD	
5. Testing Agency		
6. Other	Dr. Clarence Welti, P.E., P.C.	227 Williams Street Glastonbury, CT, 06033 (860) 633-4623

Note: The inspectors and testing agencies shall be engaged by the Owner or the Owner's Agent, and not by the Contractor or Subcontractor whose work is to be inspected or tested. Any conflict of interest must be disclosed to the Building Official, prior to commencing work.

Quality Assurance Plan

Quality Assurance for Seismic Resistance

Seismic Design Category	*B*
Quality Assurance Plan Required (Y/N)	*N*

Description of seismic force resisting system and designated seismic systems:
Combination Ordinary Moment Frame, and Shear Walls

Quality Assurance for Wind Requirements

Basic Wind Speed (3 second gust) 112 MPH	*Vasd (Groton)*
Wind Exposure Category	*B*
Quality Assurance Plan Required (Y/N)	*N*

Description of wind force resisting system and designated wind resisting components:
Same as Seismic

Statement of Responsibility

Each contractor responsible for the construction or fabrication of a system or component designated above must submit a Statement of Responsibility.

Qualifications of Inspectors and Testing Technicians

The qualifications of all personnel performing Special Inspection and testing activities are subject to the approval of the Building Official. The credentials of all Inspectors and testing technicians shall be provided if requested.

Key for Minimum Qualifications of Inspection Agents:

When the Registered Design Professional in Responsible Charge deems it appropriate that the individual performing a stipulated test or inspection have a specific certification or license as indicated below, such designation shall appear below the *Agency Number* on the Schedule.

PE/SE	Structural Engineer – a licensed SE or PE specializing in the design of building structures
PE/GE	Geotechnical Engineer – a licensed PE specializing in soil mechanics and foundations
EIT	Engineer-In-Training – a graduate engineer who has passed the Fundamentals of Engineering examination

American Concrete Institute (ACI) Certification

ACI-CFTT	Concrete Field Testing Technician – Grade 1
ACI-CCI	Concrete Construction Inspector
ACI-LTT	Laboratory Testing Technician – Grade 1&2
ACI-STT	Strength Testing Technician

American Welding Society (AWS) Certification

AWS-CWI	Certified Welding Inspector
AWS/AISC-SSI	Certified Structural Steel Inspector

American Society of Non-Destructive Testing (ASNT) Certification

ASNT	Non-Destructive Testing Technician – Level II or III.

International Code Council (ICC) Certification

ICC-SMSI	Structural Masonry Special Inspector
ICC-SWSI	Structural Steel and Welding Special Inspector
ICC-SFSI	Spray-Applied Fireproofing Special Inspector
ICC-PCSI	Prestressed Concrete Special Inspector
ICC-RCSI	Reinforced Concrete Special Inspector

National Institute for Certification in Engineering Technologies (NICET)

NICET-CT	Concrete Technician – Levels I, II, III & IV
NICET-ST	Soils Technician - Levels I, II, III & IV
NICET-GET	Geotechnical Engineering Technician - Levels I, II, III & IV

Exterior Design Institute (EDI) Certification

EDI-EIFS	EIFS Third Party Inspector

Other

_____ _____

Soils and Foundations

Item	Agency # (Qualif.)	Scope
1. Shallow Foundations	4,6 PE/GE	Inspect soils below footings for adequate bearing capacity and consistency with geotechnical report. Inspect removal of unsuitable material and preparation of subgrade prior to placement of controlled fill Geotechnical Engineer to inspect subgrade prior to footing placement.
2. Controlled Structural Fill	4,6 PE/GE	Perform sieve tests (ASTM D422 & D1140) and modified Proctor tests (ASTM D1557) of each source of fill material. Inspect placement, lift thickness and compaction of controlled fill. Test density of each lift of fill by nuclear methods (ASTM D2922) Verify extent and slope of fill placement.
3. Deep Foundations	NA	
4. Load Testing	NA	
4. Other:	NA	

Item	Agency # (Qualif.)	Scope
1. Mix Design	1 ACI-CCI ICC-RCSI	Review concrete batch tickets and verify compliance with approved mix design. Verify that water added at the site does not exceed that allowed by the mix design.
2. Material Certification		
3. Reinforcement Installation	4 ACI-CCI ICC-RCSI	Inspect size, spacing, cover, positioning and grade of reinforcing steel. Verify that reinforcing bars are free of form oil or other deleterious materials. Inspect bar laps and mechanical splices. Verify that bars are adequately tied and supported on chairs or bolsters
4. Post-Tensioning Operations	NA	
5. Welding of Reinforcing	4 AWS-CWI	Visually inspect all reinforcing steel welds. Verify weldability of reinforcing steel. Inspect preheating of steel when required.
6. Anchor Rods	4	Inspect size, positioning and embedment of anchor rods. Inspect concrete placement and consolidation around anchors.
7. Concrete Placement	4 ACI-CCI ICC-RCSI	Inspect placement of concrete. Verify that concrete conveyance and depositing avoids segregation or contamination. Verify that concrete is properly consolidated.
8. Sampling and Testing of Concrete	4 ACI-CFTT ACI-STT	Test concrete compressive strength (ASTM C31 & C39), slump (ASTM C143), air-content (ASTM C231 or C173) and temperature (ASTM C1064).
9. Curing and Protection	1,4 ACI-CCI ICC-RCSI	Inspect curing, cold weather protection and hot weather protection procedures.
10. Other:		

Item	Agency # (Qualif.)	Scope
1. Material Certification	1	Review material certifications to confirm compliance with specifications.
2. Mixing of Mortar and Grout	4 ICC-SMSI	Inspect proportioning, mixing and retempering of mortar and grout.
3. Installation of Masonry	4 ICC-SMSI	Inspect size, layout, bonding and placement of masonry units.
4. Mortar Joints	4 ICC-SMSI	Inspect construction of mortar joints including tooling and filling of head joints.
5. Reinforcement Installation	4 ICC-SMSI AWS-CWI	Inspect placement, positioning and lapping of reinforcing steel. Inspect welding of reinforcing steel.
6. Prestressed Masonry	NA	
7. Grouting Operations	4 ICC-SMSI	Inspect placement and consolidation of grout. Inspect masonry clean-outs for high-lift grouting.
7. Weather Protection	1,4 ICC-SMSI	Inspect cold weather protection and hot weather protection procedures. Verify that wall cavities are protected against precipitation.
9. Evaluation of Masonry Strength	4 ICC-SMSI	Test compressive strength of mortar and grout cube samples (ASTM C780). Test compressive strength of masonry prisms (ASTM C1314). Take prisms every 5,000 s.f. of wall area.
10. Anchors and Ties	4 ICC-SMSI	Inspect size, location, spacing and embedment of dowels, anchors and ties.
11. Other:		

Item	Agency # (Qualif.)	Scope
1. Fabricator Certification/ Quality Control Procedures ☒ Fabricator Exempt	1,4 AWS/AIS C-SSI ICC-SWSI	Review shop fabrication and quality control procedures. Conduct one ½ day inspection of existing fabrication facilities to review shop standards and quality control procedures.
2. Material Certification	1 AWS/AIS C-SSI ICC-SWSI	Review certified mill test reports and identification markings on wide-flange shapes, high-strength bolts, nuts and welding electrodes
3. Open Web Steel Joists	NA	
4. Bolting	NA	
5. Welding	4 AWS-CWI ASNT	Visually inspect all welds. Inspect pre-heat, post-heat and surface preparation between passes. Verify size and length of fillet welds.
6. Shear Connectors	NA	
7. Structural Details	1,4 PE/SE	Inspect steel lintels for compliance with structural drawings, including bracing, member configuration and connection details.
8. Metal Deck		
9. Other:		

Item	Agency # (Qualif.)	Scope
1. Fabricator Certification/ Quality Control Procedures ☐ Fabricator Exempt	4	Review truss fabricators quality control procedures.
2. Material Grading	NA	
3. Connections	1,4	Connections to masonry walls, truss lateral bracing, and all blocking shall be inspected for compliance with design drawings and approved shop drawings.
4. Framing and Details	1,4	Inspect the installation of all trusses, truss lateral bracing and all connections to masonry walls f or compliance with design drawings and approved shop drawings.
5. Diaphragms and Shearwalls	4	Inspect installation of plywood sheathing to confirm plywood thickness and attachment to timber trusses.
6. Prefabricated Wood Trusses		See 3 above.
7. Permanent Truss Bracing	1,4	Inspect the installation of all timber truss bracing to ensure compliance with approved shop drawings.
8. Other:
