1.0 INTRODUCTION

On behalf of the Connecticut Department of Transportation (ConnDOT), Maguire Group Inc. (MGI) has conducted a Task 210 - Subsurface Site Investigation in association with the New Haven Rail Yard Component Change Out Facility project in New Haven, Connecticut. The project will involve the construction of a Component Change Out Shop building along Brewery Street and to the east of the existing EMU Shop building. Figure 1 depicts the project area.

This Task 210 - Subsurface Site Investigation was conducted in areas of anticipated construction activities for the New Haven Rail Yard Component Change Out Facility project. The purpose of the Task 210 - Subsurface Site Investigation was to verify the absence or presence and location of subsurface contamination, and to assess the potential pollutant impacts to be encountered during construction. It is anticipated that Task 310 Plans and Specifications will subsequently be prepared to assess construction related activities (i.e. proper storage, classification, transport and disposal of contaminated materials), in relationship to the environmental conditions prevalent within the project limits, as well as to specify remedial work to be included in the Contract Bid Documents.

2.0 SITE DESCRIPTION

This Task 210 - Subsurface Site Investigation was conducted at the New Haven Rail Yard in the area of the proposed Component Change Out Facility. The proposed Component Change Out Facility will be constructed to the east and southeast of the existing EMU Shop building on land owned by the State of Connecticut Department of Transportation. The site area is depicted in Figures 2a through 2d -Task 210 Project Area & Sampling Locations.

 New Haven, Connecticut

Numerous environmental investigations completed at the New Haven Rail Yard property have indicated the widespread presence of total petroleum hydrocarbons, volatile organic compounds, polycyclic aromatic hydrocarbons (PAHs), and RCRA 8 metals contamination, as well as isolated occurrences of polychlorinated biphenyls (PCBs) in on-site soils and groundwater. The contaminated soil has been encountered at depths ranging from the surface (0) to approximately eight (8) feet below the ground surface. The soil and groundwater contamination detected exceeded the applicable Connecticut Department of Environmental Protection Remediation Standard Regulations. In addition, the concentrations of leachable lead previously detected in on-site soils at the site have exceeded the RCRA hazardous waste concentration in isolated areas.

3.0 LOCAL ENVIRONMENT & RECEPTORS

3.1 Groundwater

The 2005 edition of "Environmental GIS Data for Connecticut" provided by the CTDEP, depicts the groundwater classification for the area as "GB." A "GB" groundwater classification indicates that the groundwater has been adversely impacted by waste discharges, spills or leaks of chemicals, or land use impacts. The groundwater is not suitable for direct human consumption without the need for treatment and a public water supply source is available. Groundwater was encountered at the site at depths ranging from approximately 4 to 6 feet below the ground surface. The New Haven Rail Yard and its surrounding properties are all connected to the South Central Regional Water Company's public water distribution system and the City of New Haven sewer system. In addition, there are no public water supply sources within a one-mile radius of the Site, according to the CTDEP Bulletin 4, "The Atlas of the Public Water Supply Sources and Drainage Basins of Connecticut," June, 1982.

3.2 Surface Water

There are no surface water bodies situated on the New Haven Rail Yard property. The project area is located within the South Central Shoreline Regional Drainage Basin, within the South Central Coast Major Drainage Basin. The general topography of the site is relatively flat. Based upon previous investigations conducted at the site, the inferred direction of groundwater flow is south/southeast, towards Long Island Sound. Long Island Sound is located approximately ½ mile southeast of the New Haven Rail Yard.

3.3 Geology

The 2005 edition of “Environmental GIS Data for Connecticut” provided by the CTDEP, depicts the surficial materials at the site as Artificial Fill, which is described as earth materials and manmade materials that have been artificially placed. Soil encountered during this investigation consisted of brown to red-brown sand units, and fill comprised of black ash and cinders. The Bedrock Geological Map of Connecticut, compiled by John Rodgers in 1985, indicates that the bedrock unit underlying the site area is the New Haven Arkose, which is a red-brown arkosic sandstone. Bedrock was not encountered during this investigation.

4.0 SUBSURFACE INVESTIGATION

Due to the contaminants previously detected in the soil and groundwater on the New Haven Rail Yard property, a comprehensive sampling program was conducted within the proposed construction areas to be impacted by the Component Change Out Facility project. The following subsections detail the investigation.

4.1 Geoprobe® Soil Borings & Soil Sample Analyses

On May 23, 24, and 25, 2007, twenty (20) Geoprobe® soil borings (CCO-1 to CCO-20) were advanced in areas of anticipated construction activities for the Component Change Out Facility. The Geoprobe® borings were advanced by Logical Environmental Solutions, under the direction of MGI. The locations of the Geoprobe® soil borings are depicted on Figures 2a to 2d - Task 210 Project Area & Sampling Locations.

The Geoprobe® soil borings were advanced to a depth of 8 feet below grade. Continuous soil samples were collected utilizing a 4-foot long, 2-inch diameter Macro Core Sampler with dedicated acetate liners. The soil samples were visually inspected in the field for staining, and described as to physical characteristics and soil type. In addition, the soil samples were screened in the field for total volatile organic compounds utilizing a Photovac photoionization detector (PID). Soil boring logs were generated in the field by Maguire field personnel. The boring logs denote the types of soil encountered, the depth to groundwater and/or bedrock, the total depth reached in each boring, and the highest observed PID reading. Copies of the boring logs are included at the end of this report in Appendix A.

Based upon field screening results and visual observations, one soil sample from each boring was placed in glassware supplied by Spectrum Analytical Laboratory, and stored in an ice-filled cooler. The shallow soil sample (2' to 4' below grade) was selected for laboratory analyses if field screening and visual observation did not indicate the presence of contaminants in the other sample intervals. The analyses for each soil sample included volatile organic compounds (VOCs) utilizing EPA Method 8260, semi-volatile organic compounds (SVOCs) utilizing EPA Method 8270, petroleum hydrocarbons utilizing the Connecticut ETPH method, pesticides utilizing EPA Method 8081A, polychlorinated biphenyls (PCBs) utilizing EPA Method 8082, and total and SPLP RCRA 8 metals.

All Geoprobe® soil borings were back-filled upon completion utilizing clean sand and/or hydrated bentonite. All down-hole sampling equipment was decontaminated in accordance with MGI's May 2007 Task 210 - Subsurface Site Investigation Work Plan.

4.2 Ballast Grab Sample Collection & Analyses

Eight (8) ballast grab samples were collected from selected locations where existing tracks will be removed. The ballast grab samples were placed in glassware supplied by Spectrum Analytical Laboratory, and stored in an ice-filled cooler. The analyses for each ballast grab sample included VOCs (EPA Method 8260), SVOCs (EPA Method 8270), petroleum hydrocarbons (Connecticut ETPH), pesticides (EPA Method 8081A), PCBs (EPA Method 8082), and total and SPLP RCRA 8 metals. The locations of the ballast sample points (CCOB-1 through CCOB-8) are depicted on Figures 2b and 2c – Task 210 Project Area & Sampling Locations.

4.3 Concrete Sample Collection & Analyses

Six (6) concrete samples were collected from selected areas where existing concrete structures will be removed. The concrete samples were collected using a rotary hammer drill that pulverized the concrete into powder form. The concrete samples were collected from the surface of the concrete to approximately six-inches (0.5 feet) deep into the concrete. The concrete samples were placed in glassware supplied by Spectrum Analytical Laboratory, and stored in an ice-filled cooler. The analyses for each concrete sample included VOCs (EPA Method 8260), SVOCs (EPA Method 8270), petroleum hydrocarbons (Connecticut ETPH), pesticides (EPA Method 8081A), PCBs (EPA Method 8082), and total and SPLP RCRA 8 metals. The locations of the concrete sample points (CCOC-1 to CCOC-6) are depicted on Figures 2a to 2c – Task 210 Project Area & Sampling Locations.

4.4 Railroad Tie Grab Sample Collection & Analyses

Two (2) composite railroad tie wood grab samples were collected at selected locations where existing tracks will be removed so that specifications regarding handling and disposal of the material can be provided. The railroad tie wood grab samples were placed in glassware supplied by Spectrum Analytical Laboratory, and stored in an ice-filled cooler. The analyses for each wood sample included VOCs (EPA Method 8260), SVOCs (EPA Method 8270), petroleum

hydrocarbons (Connecticut ETPH), pesticides (EPA Method 8081A), PCBs (EPA Method 8082), and total and TCLP RCRA 8 metals. The locations of the railroad tie sample points (CCOT-1 and CCOT-2) are depicted on Figures 2b and 2c – Task 210 Project Area & Sampling Locations.

4.5 Groundwater Grab Sample Collection & Analyses

Groundwater grab samples were collected from borings CCO-1, CCO-14, and CCO-15. The groundwater grab samples were collected by inserting one-half inch diameter, schedule 40, 10-slot, PVC well screen and riser casing into the borehole. The 5-foot section of well screen was temporarily installed approximately 4 feet into the observed water table depth. Dedicated polyethylene tubing was placed into the temporary well and the groundwater sample was drawn through the tubing using a low-flow peristaltic pump.

The groundwater samples were collected for laboratory analysis of VOCs (EPA Method 8260), SVOCs (EPA Method 8270), petroleum hydrocarbons (Connecticut ETPH), pesticides (EPA Method 8081A), PCBs (EPA Method 8082), and total RCRA 8 metals. The groundwater samples were placed in laboratory-supplied glassware, and stored in an ice-filled cooler.

4.6 Project Quality Assurance/Quality Control Practices

To assess the collection of samples in the field in terms of the sampling techniques and decontamination procedures followed, quality control and quality assurance samples were collected. Two (2) trip blank samples (TB-1 and TB-2) were prepared by Spectrum Analytical Laboratory and one (1) field blank sample (FB-1) was collected in the field.

The trip blank samples were stored with the daily samples in the sample cooler until subsequent delivery to the laboratory for analysis of VOCs. The field blank water sample was collected by pouring laboratory supplied de-ionized water through an acetate liner and macro-core cutting shoe, and collecting the rinsate in appropriate sample containers. The field blank sample was stored with the daily samples in the cooler until delivery to the laboratory, and was analyzed for the same parameters as the daily samples.

All samples collected in the field were stored in a manner that preserved the integrity of the sample chemistry. Samples intended for organic analyses were stored in an ice-filled cooler until delivery to the laboratory. Chain-of-Custody (COC) forms were filled out and accompanied all samples collected as a legal record of possession of the sample. The COC was initiated in the field and accompanied the containers during sample collection, transportation to the lab, analysis, and final disposal of the sample. All sampling equipment was either dedicated to a specific sample or was decontaminated prior to and between each use. Sampling equipment was not placed near solvents, gasoline, or materials that may impact the integrity of the samples.

5.0 DISCUSSION OF SAMPLE RESULTS

5.1 Regulatory Criteria

The CTDEP adopted Remediation Standard Regulations (Regulations of Connecticut State Agencies, Section 22a-133k-1 to 3 and 22a-133q-1) as of January 31, 1996. The Remediation Standard Regulations (RSRs) apply to any site undergoing voluntary remediation under Public Acts 95-183 or 95-190, a transfer of an "establishment" under Public Act 95-183, or any site as ordered by the CTDEP Commissioner. The Regulations also outline the processes for establishing alternative site-specific numerical standards for certain sites, upon approval by the CTDEP.

The RSRs criteria applicable to the soil and groundwater sampled during this investigation are summarized below. The application of these RSRs to the results of the laboratory analyses from this investigation is discussed in subsections 5.2, 5.3, 5.4, 5.5, and 5.6 of this section.

Soils Criteria: The RSRs are organized into two sets of criteria: the Direct Exposure Criteria (DEC) and the Pollutant Mobility Criteria (PMC). The DEC and PMC are briefly explained in the following sub-sections, in relation to how they would be applicable to the types of analyses conducted on the soil samples collected for this investigation. Please refer to the RSRs for a complete explanation of the Regulations.

Direct Exposure Criteria

The purpose of the DEC is to protect human health from risks associated with the direct contact with or ingestion of various common soil contaminants. The DEC are applicable to soil within approximately 15 feet of the ground surface. Concentrations of contaminants are evaluated based upon mass-based analyses and different criteria are established for residential and commercial/industrial properties. The use of the less stringent commercial/industrial standards requires the placement of a land use restriction on the property.

The DEC are not applicable to inaccessible soils, including soil more than 4 feet below the ground surface, 2 feet below pavement greater than 3 inches thick, or below an existing building, provided that an Environmental Land Use Restriction (ELUR) is placed in effect for the property.

Pollutant Mobility Criteria

The purpose of the PMC is to evaluate the potential for contaminants to leach from the soil in concentrations that may degrade groundwater quality. Different numerical criteria are established for GA and GAA groundwater areas, versus GB groundwater areas. Since the project area is situated within a GB groundwater area, the least stringent criteria apply.

Groundwater Criteria: Contaminants in the groundwater are compared either to background quality or the Groundwater Protection Criteria (GPC), the Volatilization Criteria, as well as the Surface Water Protection Criteria (SWPC). The GPC, Volatilization Criteria, and SWPC are briefly explained in the following sub-sections, in relation to how they would be applicable to the types of analyses conducted on the groundwater samples collected for this investigation.

Groundwater Protection Criteria

The purpose of the GPC is to protect the groundwater quality in areas that have the potential to use groundwater as a drinking water resource (GA & GAA groundwater classification areas). Since the project area is situated in a GB groundwater area, the GPC do not apply to this Site.

Volatilization Criteria

The purpose of the Volatilization Criteria standard is to ensure that volatile organic compounds (VOCs) in groundwater do not pose an unacceptable risk to human health due to the inhalation of VOCs that may enter into a structure on the property. The Volatilization Criteria only apply when impacted groundwater is located within 15 feet of the ground surface or any structure. Different criteria exist for residential and commercial/industrial properties. The use of the less stringent commercial/industrial standards requires the placement of an ELUR on the property. Since groundwater was within 15 feet of the ground surface, the Volatilization Criteria apply to this Site.

Surface Water Protection Criteria

The purpose of the SWPC standards is to ensure that groundwater discharging to a surface water body will not adversely affect surface water quality. Since groundwater likely discharges to Long Island Sound, the SWPC apply to contaminants detected in the groundwater.

5.2 Results of Geoprobe® Boring Soil Sample Analyses

Soil samples collected during the advancement of the Geoprobe® borings were sent to Spectrum Analytical Laboratory for laboratory analyses. Summaries of the laboratory results from the soil samples are presented in Tables 1(a) to 1(e), which are located at the end of this report, and copies of the soil sample analytical results are included in Appendix C. The following summarizes the results of the analyses conducted on the soil samples.

Petroleum hydrocarbons were detected in the soil samples at concentrations ranging from Below Reporting Limits (BRL) to 3,980 parts per million (ppm). The following six (6) soil samples contained TPH at concentrations that exceed the CTDEP Residential DEC of 500 ppm: CCO-6, 2' to 4' (592 ppm); CCO-8, 2' to 4' (629 ppm); CCO-9, 2' to 4' (819 ppm); CCO-10, 2' to 4' (779 ppm); CCO-19, 2' to 4' (3,980 ppm); and CCO-20, 4' to 8' (888 ppm). The petroleum hydrocarbon concentration detected in the CCO-19, 2' to 4' sample also exceeds the Commercial/Industrial DEC of 2,500 ppm. No other sample contained petroleum hydrocarbons at concentrations that exceed any applicable CTDEP RSR criteria.

The VOCs acetone, benzene, ethylbenzene, naphthalene, n-propylbenzene, styrene, toluene, 1,2,4-trichloroethene, and total xylenes were detected at varying concentrations in the soil samples collected from borings CCO-2, CCO-3, CCO-4, CCO-6, CCO-7, CCO-9, CCO-10, CCO-12, CCO-15, CCO-17, CCO-19, and CCO-20. Benzene was detected in the 2 to 4 foot samples collected from borings CCO-6 (1.42 ppm) and CCO-19 (0.33 ppm) at concentrations that exceed its GB PMC of 0.2 ppm. No other soil sample contained VOCs at concentrations that exceed any applicable CTDEP RSR criteria.

Various concentrations of SVOCs were detected in the soil samples, and total SVOC concentrations ranged from BRL to 395.33 ppm. Five (5) soil samples contained concentrations of SVOCs that exceed applicable CTDEP RSR Criteria. The 2 to 4 foot sample from boring CCO-3 contained the compounds benzo(a)anthracene (1.11 ppm), benzo(a)pyrene (1.13 ppm), benzo(b)fluoranthene (1.24 ppm), and chrysene (1.31 ppm) at concentrations that exceed their respective GB PMC. In addition, the compounds benzo(a)anthracene, benzo(a)pyrene, and benzo(b)fluoranthene were detected at concentrations that exceed their respective Residential DEC. The compound benzo(a)pyrene was detected at a concentration that also exceeds its Commercial/Industrial DEC.

The 2 to 4 foot sample from boring CCO-10 contained the compounds benzo(a)anthracene (3.05 ppm), benzo(a)pyrene (4.34 ppm), benzo(b)fluoranthene (5.05 ppm), benzo(k)fluoranthene (4.25 ppm), and chrysene (4.77 ppm) at concentrations that exceed their respective GB PMC. In addition, the compounds benzo(a)anthracene, benzo(a)pyrene, and benzo(b)fluoranthene were detected at concentrations that exceed their respective Residential DEC. The compound benzo(a)pyrene was detected at a concentration that also exceeds its Commercial/Industrial DEC.

The 2 to 4 foot sample from boring CCO-16 contained the compounds benzo(b)fluoranthene (1.02 ppm) and chrysene (1.08 ppm) at concentrations that exceed their respective GB PMC. In addition, the compound benzo(b)fluoranthene was detected at a concentration that exceeds its Residential DEC.

The 2 to 4 foot sample from boring CCO-19 contained the compounds benzo(a)anthracene (25.8 ppm), benzo(a)pyrene (48.7 ppm), benzo(b)fluoranthene (25.2 ppm), benzo(k)fluoranthene (19.3 ppm), chrysene (37.4 ppm), dibenz(a,h)anthracene (4.28 ppm), indeno(1,2,3-cd)pyrene (14.9 ppm), and pyrene (104.0 ppm) at concentrations that exceed their respective GB PMC. In addition, the compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene were detected at concentrations that exceed their respective Residential DEC. The compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene were detected at concentrations that also exceeds their respective Commercial/Industrial DEC.

The 4 to 8 foot sample from boring CCO-20 contained the compounds benzo(a)anthracene (6.69 ppm), benzo(a)pyrene (8.85 ppm), benzo(b)fluoranthene (6.86 ppm), benzo(k)fluoranthene (4.39 ppm), chrysene (9.77 ppm), and indeno(1,2,3-cd)pyrene (3.64 ppm) at concentrations that exceed their respective GB PMC. In addition, the compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene were detected at concentrations that exceed their respective Residential DEC. The compound benzo(a)pyrene was detected at a concentration that also exceeds its Commercial/Industrial DEC.

None of the soil samples contained detectable concentrations of pesticides. PCBs (total) were detected at varying concentrations ranging from 0.011 ppm to 0.405 ppm in the soil samples collected from borings CCO-4, CCO-10, CCO-12, CCO-15, CCO-16, and CCO-20. However, none of the soil samples contained PCBs at concentrations that exceed any applicable CTDEP RSR criteria.

Total concentrations of the metals arsenic, barium, cadmium, chromium, lead, and mercury were detected at varying concentrations in the soil samples throughout the site. The following six (6) soil samples contained total arsenic at concentrations that exceed the CTDEP Residential and Commercial/Industrial DEC of 10 ppm: CCO-10, 2' to 4' (16.2 ppm); CCO-13, 2' to 4' (14.9 ppm); CCO-15, 2' to 4' (12.0 ppm); CCO-16, 2' to 4' (14.1 ppm); CCO-18, 2' to 4' (12.2 ppm); and CCO-20, 4' to 8' (14.1 ppm). The following five (5) soil samples contained total

lead at concentrations that exceed the CTDEP Residential DEC of 500 ppm: CCO-1, 2' to 4' (670 ppm); CCO-3, 2' to 4' (1,130 ppm); CCO-12, 2' to 4' (603 ppm); CCO-19, 2' to 4' (634 ppm); and CCO-20, 4' to 8' (1,790 ppm). The concentration of total lead detected in the CCO-3 and CCO-20 soil samples also exceed the Commercial/Industrial DEC of 1,000 ppm. No other sample contained total metals at concentrations that exceed any applicable CTDEP RSR criteria.

Leachable concentrations (via SPLP) of arsenic, barium, chromium, lead, and mercury were detected at varying concentrations in the soil samples. Leachable lead was detected at an elevated concentration in the CCO-13, 2' to 4' soil sample (0.701 ppm), which exceeds its GB PMC of 0.15 ppm. No other soil sample contained leachable metals at concentrations that exceed any applicable CTDEP RSR criteria.

5.3 Results of Ballast Grab Sample Analyses

The eight ballast grab samples (CCOB-1 through CCOB-8) collected during this Task 210 investigation were sent to Spectrum Analytical Laboratory for laboratory analyses. Summaries of the laboratory results from the ballast grab samples are presented in Tables 2(a) and 2 (b), which are located at the end of this report, and copies of the ballast grab sample analytical results are included in Appendix D. The following summarizes the results of the analyses conducted on the ballast grab samples. For the purpose of comparison, the results of the ballast grab sample analyses were compared to the CTDEP RSR soil criteria.

SVOCs, pesticides, PCBs, and leachable metals (via SPLP) were not detected in the ballast grab samples. The ballast samples contained petroleum hydrocarbons at concentrations ranging from BRL to 39.7 ppm. However, none of the ballast samples contained petroleum hydrocarbons at concentrations that exceed any CTDEP RSR criteria.

The VOCs acetone, 2-butanone, and naphthalene were detected at varying low concentrations in the CCOB-1, CCOB-3, CCOB-5, CCOB-6, CCOB-7, and CCOB-8 ballast samples. Spectrum Analytical Laboratory acknowledged that acetone and 2-butanone are commonly seen when using the sample extraction technique. In addition, acetone and 2-butanone were detected in the laboratory trip blank sample (TB-1). None of the VOCs detected in the ballast samples exceed any CTDEP RSR criteria.

Total concentrations of the metals arsenic, barium, cadmium, chromium, and lead were detected at varying concentrations in the ballast grab samples. However, the samples did not contain total metals at concentrations that exceed any CTDEP RSR criteria.

5.4 Results of Concrete Sample Analyses

The six concrete samples (CCOC-1 through CCOC-6) collected during this Task 210 investigation were sent to Spectrum Analytical Laboratory for laboratory analyses. Summaries of the laboratory results from the concrete samples are presented in Tables 3(a) to 3(c), which are located at the end of this report, and copies of the concrete sample analytical results are included in Appendix E. The following summarizes the results of the analyses conducted on the concrete samples. For the purpose of comparison, the results of the concrete sample analyses were compared to the CTDEP RSR soil criteria.

The concrete samples contained petroleum hydrocarbons at concentrations ranging from BRL to 202 ppm. However, none of the concrete samples contained petroleum hydrocarbons at concentrations that exceed any CTDEP RSR criteria.

The CCOC-2 and CCOC-3 concrete samples contained the VOC naphthalene at low concentrations of 0.267 ppm and 0.0057 ppm, respectively, which do not exceed the CTDEP RSR criteria.

* The concrete samples did not contain detectable concentrations of SVOCs and pesticides. PCBs were detected in the CCOC-4 (0.0209 ppm) and CCOC-6 (0.0163 ppm) samples at low concentrations that do not exceed any CTDEP RSR criteria.

Total and leachable concentrations of the metals arsenic, barium, cadmium, chromium, and lead were detected at varying concentrations in the concrete samples. However, the samples did not contain total or leachable metals at concentrations that exceed any CTDEP RSR criteria.

5.5 Results of Railroad Tie Grab Sample Analyses

The two railroad tie grab samples (CCOT-1 and CCOT-2) collected during this Task 210 investigation were sent to Spectrum Analytical Laboratory for laboratory analyses. Summaries of the laboratory results from the railroad tie grab samples are presented in Table 4, which is located at the end of this report, and copies of the railroad tie grab sample analytical results are included in Appendix F. The following summarizes the results of the analyses conducted on the railroad tie grab samples. For the purpose of comparison, the results of the railroad tie grab sample analyses were compared to the CTDEP RSR soil criteria.

Petroleum hydrocarbons were detected in the CCOT-1 (150,000 ppm) and CCOT-2 (120,000 ppm) samples at concentrations that exceed the GB PMC and Residential DEC of 500 ppm, and the *Commercial/Industrial DEC* of 2,500 ppm. Both of the railroad tie samples contained the VOC naphthalene at elevated concentrations of 3,550 ppm (CCOT-1) and 1,930 ppm (CCOT-2), which exceed the GB PMC of 56 ppm and Residential DEC of 1,000 ppm. In addition, the concentration of naphthalene detected in the CCOT-2 sample also exceeds the *Commercial/Industrial DEC* of 2,500 ppm.

The railroad tie samples contained several SVOCs at varying elevated concentrations. The CCOT-1 sample contained the SVOCs acenaphthene (5,530 ppm), anthracene (5,170 ppm), dibenzofuran (3,420 ppm), fluoranthene (9,190 ppm), fluorene (5,050 ppm), naphthalene (3,510 ppm), phenanthrene (14,300 ppm), and pyrene (6,870 ppm) at concentrations that exceed their respective GB PMC, Residential DEC, and *Commercial/Industrial DEC*.

The CCOT-2 sample contained the SVOCs acenaphthene (8,490 ppm), anthracene (7,750 ppm), chrysene (1,980 ppm), dibenzofuran (5,160 ppm), fluoranthene (12,900 ppm), fluorene (6,750 ppm), naphthalene (3,510 ppm), phenanthrene (21,100 ppm), and pyrene (9,560 ppm) at concentrations that exceed their respective GB PMC, Residential DEC, and Commercial/Industrial DEC.

The railroad tie samples did not contain detectable concentrations of pesticides and PCBs. Total and leachable (via TCLP) concentrations of the metals barium, lead, and mercury were detected at varying concentrations in the railroad tie grab samples. However, the samples did not contain total or leachable metals at concentrations that exceed any CTDEP RSR criteria.

5.6 Results of Groundwater Grab Sample Analyses

The three (3) groundwater grab samples (CCO-1 GW, CCO-13 GW, and CCO-15 GW) collected from the project area during the advancement of the Geoprobe® borings were sent to Spectrum Analytical Laboratory for laboratory analyses. Summaries of the laboratory results from the groundwater grab samples are presented in Tables 5(a) and 5(b), which are located at the end of this report, and copies of the groundwater analytical results are included in Appendix G. The following summarizes the results of the groundwater grab sample analyses.

The groundwater samples did not contain detectable concentrations of pesticides, and PCBs. The CCO-1 GW sample contained petroleum hydrocarbons at a concentration of 2.4 ppm, which does not exceed any applicable CTDEP criteria. No other groundwater sample contained detectable concentrations of petroleum hydrocarbons.

The VOCs benzene, 1,1-dichloroethane, cis-1,2-dichloroethene, naphthalene, and vinyl chloride were detected in the CCO-1 and CCO-15 groundwater samples. The CCO-1 GW sample contained vinyl chloride (2.1 parts per billion [ppb]) which exceeds the Residential and Commercial/Industrial DEC of 2 ppb.

The CCO-1 GW sample contained the SVOCs phenanthrene (0.321 ppb) and pyrene (0.231 ppb). The concentration of phenanthrene detected in the sample exceeds its SWPC of 0.3 ppb.

The groundwater samples contained total arsenic, barium, chromium, lead, and mercury at varying concentrations. The CCO-1 GW sample contained total arsenic (0.0244 ppm), total lead (2.43 ppm), and total mercury (0.0182 ppm) at concentrations that exceed their respective SWPC of 0.004 ppm, 0.013 ppm, and 0.0004 ppm. The CCO-13 GW sample contained total arsenic (0.0047 ppm) at a concentration that exceeds its SWPC of 0.0004 ppm. The CCO-15 GW sample contained total arsenic (0.0083 ppm) and total lead (0.105 ppm) at concentrations that exceed their respective SWPC of 0.004 ppm and 0.013 ppm. No other metals were detected at concentrations that exceed any applicable CTDEP RSR criteria.

5.7 Quality Assurance/Quality Control Samples

The field blank sample (FB-1) did not contain detectable concentrations of contaminants. The TB-1 trip blank sample contained the VOCs acetone (22 ppb), 2-butanone (12.6 ppb), methyl tert-butyl ether (1.8 ppb), toluene (4.7 ppb), and total xylenes (3 ppb). The presence of these VOCs in the trip blank sample is likely due to laboratory contamination. In addition, acetone and 2-butanone were detected in several ballast grab samples submitted with this trip blank sample and the laboratory acknowledged that the presence of the VOCs in the ballast samples was a common occurrence due to the extraction technique utilized. The TB-2 trip blank sample did not contain VOCs at concentrations that exceed any laboratory detection limits. Copies of the analytical reports associated with the quality assurance/quality control samples are included in Appendix H.

6.0 DISCUSSION OF AFFECTED RESOURCES

6.1 Soil Areas of Environmental Concern

Based upon the results of laboratory analyses performed on the soil samples for this Task 210 investigation, as well as the analytical results of soil samples collected from within the project area from MGI's previous Task 210 investigations for the Interim Shop (Running Repair Shop), West End Yard Project, and Temporary M-8 Acceptance Facility, four (4) soil areas of environmental concern (AOECs) have been identified where contaminants are present at concentrations that exceed applicable CTDEP RSR criteria. In addition, the remainder of the project site has been designated as a low-level area of environmental concern (LLAOEC) for soil. In these areas contaminants were detected at concentrations below applicable CTDEP RSR standards, but above laboratory detection limits. The locations of the AOECs within the project area are discussed in the following sections. Tables summarizing the analytical results from soil samples collected during MGI's February 2005 Task 210 for the Interim Shop (Running Repair Shop), May 2007 West End Yard Project, February 2007 Temporary M-8 Acceptance Facility, are included in Appendix B of this report. In addition, the locations of the former borings denoted as IS-#, WEY-#, and M8F-# are depicted on Figures 2a through 2d – Task 210 Project Area & Sampling Locations.

AOEC #1: Area Encompassing Borings WEY-25, IS-41, CCO-1, CCO-3, & WEY-33:

Analytical results from the soil samples collected from borings WEY-25, IS-41, CCO-1, CCO-3, and WEY-33 indicate the presence of petroleum hydrocarbon, tetrachloroethene, SVOC, total arsenic, and total lead contamination at slightly elevated concentrations in shallow soil ranging from 2 to 4 feet below grade. The contamination detected exceeds the GB PMC, Residential DEC, and Commercial/Industrial DEC.

AOEC #2: Area Encompassing Borings M8F-17 & M8F-28:

Analytical results from the soil samples collected from borings M8F-17 and M8F-28 indicate the presence of petroleum hydrocarbon and SVOC contamination at elevated concentrations in shallow soil ranging from 2 to 6 feet below grade. The contamination detected exceeds the GB PMC, Residential DEC, and Commercial/Industrial DEC.

AOEC #3: Area Encompassing Borings M8F-31, M8F-32, M8F-35, M8F-36, CCO-6, CCO-8, CCO-9, CCO-10, CCO-12, M8F-41, M8F-42, M8F-45, M8F-46, M8F-47, WEY-37, WEY-38, CCO-15, CCO-16, CCO-18, CCO-19 & CCO-20:

Analytical results from the soil samples collected from borings M8F-31, M8F-35, M8F-36, CCO-6, CCO-8, CCO-9, CCO-10, CCO-12, M8F-41, M8F-42, M8F-45, M8F-46, M8F-47, WEY-37, WEY-38, CCO-15, CCO-16, CCO-18, CCO-19 & CCO-20 indicate the presence of total arsenic, total lead, petroleum hydrocarbon, benzene, SVOC, and pesticide (dieldrin) contamination at elevated concentrations in shallow soil ranging from 2 to 6 feet below grade. The contamination detected exceeds the GB PMC, Residential DEC, and Commercial/Industrial DEC. This AOEC also encompasses boring M8F-32, although contaminants at this location were detected at concentrations slightly below CTDEP RSR criteria.

AOEC #4: Area Encompassing Borings WEY-39 & CCO-13:

Analytical results from the soil samples collected from borings WEY-39 & CCO-13 indicate the presence of total arsenic and leachable lead contamination at elevated concentrations in shallow soil ranging from 2 to 4 feet below grade. The contamination detected exceeds the GB PMC, Residential DEC, and Commercial/Industrial DEC.

6.2 Railroad Tie Area of Environmental Concern

Analytical results from the railroad tie grab samples CCOT-1 and CCOT-2 indicate the presence of petroleum hydrocarbons, VOC (naphthalene), and SVOCs at elevated concentrations that exceed the GB PMC, Residential DEC, and Commercial/Industrial DEC. The concentrations however, do not exceed the RCRA hazardous waste toxicity concentrations. All areas where railroad ties will be removed from the project site have been designated as a Railroad Tie Area of Environmental Concern (RTAOEC).

6.3 Groundwater Area of Environmental Concern

Analytical results from the groundwater samples collected from borings CCO-1, CCO-13, CCO-15, M8F-42, and M8F-50 indicate the presence of VOCs, SVOCs, total arsenic, total mercury, and total lead at concentrations that exceed the SWPC. In addition, the CCO-1 groundwater sample contained petroleum hydrocarbons at a concentration that does not exceed any applicable CTDEP criteria, but may impact allowable discharge permit limits. Therefore, the entire project area has been designated as a Groundwater Area of Environmental Concern (GWAOEC).

7.0 RECOMMENDATIONS

The results of the Task 210 – Subsurface Site Investigation for the New Haven Rail Yard Component Change Out Facility project in New Haven, Connecticut indicate the presence of petroleum hydrocarbon, VOC, SVOC, total arsenic, total lead, and leachable lead contamination in shallow soil samples collected from the project area, at concentrations that exceed the applicable RSR criteria. Soil samples collected from within the project area in 2005 and 2007 by MGI during the Interim Shop (Running Repair Shop), West End Yard, and Temporary M-8 Acceptance Facility Task 210 projects indicated similar results. The contamination was detected in soils ranging in depth from 2 to 8 feet below grade.

The concrete that will be removed during this project is contaminated at low levels where contaminants were detected at concentrations below applicable CTDEP RSR standards, but above laboratory detection limits. It is anticipated that the concrete can be managed and disposed of as bulky waste in accordance with applicable regulations. The ballast within the project area is not considered contaminated and is suitable for re-use on the site.

Railroad tie samples collected from areas where the railroad tracks will be removed indicate the presence of petroleum hydrocarbons, VOCs, and SVOCs at concentrations that exceed the CTDEP RSR criteria, but not the RCRA hazardous waste toxicity concentrations. Groundwater collected from the site is also contaminated with VOCs, SVOCs and total metals at concentrations that exceed applicable RSR criteria. In addition, concentrations of petroleum hydrocarbons were detected in the groundwater collected from within the project area, which may impact discharge permit requirements. Four (4) Areas of Environmental Concern (AOECs) for soil, a site-wide Railroad Tie Area of Environmental Concern (RTAOEC), and a site-wide Groundwater Area of Environmental Concern (GWAEOEC) have been identified within the project area. In addition, the remainder of the project site has been designated a Low Level Area of Environmental Concern (LLAOEC) for soil. Special considerations for treatment/disposal, dewatering activities, and worker health and safety must be given to these areas in order to ensure compliance with all local, State and Federal laws. Task 310 Plans and Specifications are therefore recommended for the areas of construction within the Areas of Environmental Concern and Low-Level Areas of Environmental Concern addressing the soil, railroad tie and groundwater contamination described in Section 6.0.

8.0 LIMITATIONS

All work product and reports provided by Maguire Group Inc. (MGI) in connection with the performance of this Task 210 - Subsurface Site Investigation are subject to the following limitations:

1. The observations described in this report were made under the conditions stated therein. The conclusions presented in the report were based solely upon the services described therein, and not on scientific tasks or procedures beyond the scope of described services provided to ConnDOT.
2. In preparing this report, MGI has relied on certain information provided by State and local officials and information and representations made by other parties referenced therein, and on information contained in the files of State and/or local agencies made available to MGI at the time of this investigation. To the extent that such files are missing, incomplete or not provided to MGI, MGI is not responsible. Although there may have been some degree of overlap in the information provided by these various sources, MGI did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this investigation.
3. The conclusions and recommendations contained in this report are based in part upon the data from subsurface explorations. The nature and extent of variations between these explorations may not become evident until further explorations are completed. If variations or other latent conditions become evident, it will be necessary to re-evaluate the conclusions and recommendations of this report.
4. The water level readings made for this investigation were made at the times and conditions stated on the boring logs. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall, passage of time and other factors.

Should additional data become available in the future, these data should be reviewed by MGI, and the conclusions and recommendations presented herein modified accordingly.

5. Where quantitative laboratory analyses have been conducted by an outside certified laboratory, MGI has relied upon the data provided, and has not conducted an independent evaluation of the reliability of these tests.
6. If the conclusions and recommendations contained in this report are based, in part, upon various types of chemical data then the conclusions and recommendations are contingent upon the validity of such data. These data have been reviewed and interpretations made in the report. It should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional chemical data become available in the future, these data should be reviewed by MGI and the conclusions and recommendations presented herein modified accordingly.
7. Chemical analyses were performed for specific parameters during the course of this investigation, as described in the text. However, it should be noted that testing for all known chemical constituents was not performed. The conclusions and recommendations contained in this report are based only upon the chemical constituents for which testing was accomplished.

The following qualifications apply to the undersigned's opinion:

The activities described and opinions included herein are based on information gathered during this subsurface site investigation, which was limited in scope in adherence to the terms of our agreement. The professional opinion provided herein is based on the information described in this report.

The information contained herein was prepared for the use of ConnDOT solely in conjunction with the task descriptions for this assignment. The conclusions and recommendations set forth in this report are based on site conditions at the time of the investigation. Future studies and findings could change the contents of this report. The professional opinions presented in this report have been developed by using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental engineering consultants practicing in this or similar localities. No other warranty, expressed or implied, is made as to the professional opinions included in this report.

I attest that the information contained within the report has been reviewed for accuracy and checked against the quality control requirements for each method. These results relate only to the sample(s) as received.

All applicable NELAC requirements have been met.

Please note that this report contains 120 pages of analytical data plus Chain of Custody document(s).

This report may not be reproduced, except in full, without written approval from Spectrum Analytical, Inc.

- Massachusetts Certification # M-MA138/MA1110
- Connecticut # PH-0777
- Florida # E87600/E87936
- Maine # MA138
- New Hampshire # 2538/2972
- New Jersey # MA011/MA012
- New York # 11393/11840
- Rhode Island # 98
- USDA # S-51435
- Vermont # VT-11393

Authorized by:

Hanibal C. Tayeh, Ph.D.
President/Laboratory Director

Technical Reviewer's Initial:

Spectrum Analytical, Inc. is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Spectrum is currently accredited for the specific method or analyte indicated. Please refer to our "Quality" web page at www.spectrum-analytical.com for a full listing of our current certifications and fields of accreditation. States in which Spectrum Analytical, Inc. holds NELAC certification are New York, New Hampshire, New Jersey and Florida. All analytical work for Volatile Organic and Air analysis are transferred to and conducted at our 830 Silver Street location (NH-2972, NY-11840, FL-E87936 and NJ-MA012).

I attest that the information contained within the report has been reviewed for accuracy and checked against the quality control requirements for each method. These results relate only to the sample(s) as received.

All applicable NELAC requirements have been met.

Please note that this report contains 116 pages of analytical data plus Chain of Custody document(s).

This report may not be reproduced, except in full, without written approval from Spectrum Analytical, Inc.

Hanibal C. Tayeh, Ph.D.
President/Laboratory Director

Technical Reviewer's Initial:

Spectrum Analytical, Inc. is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Spectrum is currently accredited for the specific method or analyte indicated. Please refer to our "Quality" web page at www.spectrum-analytical.com for a full listing of our current certifications and fields of accreditation. States in which Spectrum Analytical, Inc. holds NELAC certification are New York, New Hampshire, New Jersey and Florida. All analytical work for Volatile Organic and Air analysis are transferred to and conducted at our 830 Silver Street location (NH-2972, NY-11840, FL-E87936 and NJ-MA012).

I attest that the information contained within the report has been reviewed for accuracy and checked against the quality control requirements for each method. These results relate only to the sample(s) as received.

All applicable NELAC requirements have been met.

Please note that this report contains 59 pages of analytical data plus Chain of Custody document(s).

This report may not be reproduced, except in full, without written approval from Spectrum Analytical, Inc.

Hanibal C. Tayeh, Ph.D.
 President/Laboratory Director

Technical Reviewer's Initial:

Spectrum Analytical, Inc. is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Spectrum is currently accredited for the specific method or analyte indicated. Please refer to our "Quality" web page at www.spectrum-analytical.com for a full listing of our current certifications and fields of accreditation. States in which Spectrum Analytical, Inc. holds NELAC certification are New York, New Hampshire, New Jersey and Florida. All analytical work for Volatile Organic and Air analysis are transferred to and conducted at our 830 Silver Street location (NH-2972, NY-11840, FL-E87936 and NJ-MA012).

I attest that the information contained within the report has been reviewed for accuracy and checked against the quality control requirements for each method. These results relate only to the sample(s) as received.

All applicable NELAC requirements have been met.

Please note that this report contains 145 pages of analytical data plus Chain of Custody document(s).

This report may not be reproduced, except in full, without written approval from Spectrum Analytical, Inc.

Technical Reviewer's Initial:

Spectrum Analytical, Inc. is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Spectrum is currently accredited for the specific method or analyte indicated. Please refer to our "Quality" web page at www.spectrum-analytical.com for a full listing of our current certifications and fields of accreditation. States in which Spectrum Analytical, Inc. holds NELAC certification are New York, New Hampshire, New Jersey and Florida. All analytical work for Volatile Organic and Air analysis are transferred to and conducted at our 830 Silver Street location (NH-2972, NY-11840, FL-E87936 and NJ-MA012).

* Reportable Detection Limit BRL = Below Reporting Limit

Notes and Definitions

*TPH	Calculated as
Comp	Completed
QB2	The method blank contains analyte at a concentration above the MRL, however no reportable concentration is present in the sample.
QC1	Analyte out of acceptance range.
QC2	Analyte out of acceptance range in QC spike but no reportable concentration present in sample.
QC3	The spike recovery is outside acceptable limits for the LCS. The batch was accepted based upon the MS and/or MSD meeting the LCS limits criteria.
QM4	Visual evaluation of the sample indicates the RPD is above the control limit due to a non-homogeneous sample matrix.
QR1	Analyses are not controlled on RPD values from sample concentrations less than 10 times the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.
QR2	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on percent recoveries and completeness of QC data.
QR4	Analyses are not controlled on RPD values from sample concentrations less than the reporting limit. QC batch accepted based on LCS and/or LCSD QC results
QR5	RPD out of acceptance range.
S02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
S04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
SDUP	Duplicate analysis confirmed surrogate failure due to matrix effects.
SGC	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
V11	Analyte presence was confirmed by duplicate analysis.
vex1	Lab extracted
VOC6	The production of Acetone and other ketones is commonly seen when using the SW 846 5035A extraction technique.
VOC8	Reporting limits reflect SW846 5030 extraction technique due to matrix interference using SW846 5035A extraction technique.
BRL	Below Reporting Limit - Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
NR	Not Reported
RPD	Relative Percent Difference
J	Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).

A plus sign (+) in the Method Reference column indicates the method is not accredited by NELAC.

This laboratory report is not valid without an authorized signature on the cover page.

* Reportable Detection Limit BRL = Below Reporting Limit

Page 144 of 145

Interpretation of Total Petroleum Hydrocarbon Report

Petroleum identification is determined by comparing the GC fingerprint obtained from the sample with a library of GC fingerprints obtained from analyses of various petroleum products. Possible match categories are as follows:

- Gasoline - includes regular, unleaded, premium, etc.
- Fuel Oil #2 - includes home heating oil, #2 fuel oil, and diesel
- Fuel Oil #4 - includes #4 fuel oil
- Fuel Oil #6 - includes #6 fuel oil and bunker "C" oil
- Motor Oil - includes virgin, waste automobile oil and hydraulic oil
- Ligroin - includes mineral spirits, petroleum naphtha, vm&p naphtha
- Aviation Fuel - includes kerosene, Jet A and JP-4
- Other Oil - includes lubricating and cutting oil, and silicon oil

At times, the unidentified petroleum product is quantified using a calibration that most closely approximates the distribution of compounds in the sample. When this occurs, the result is qualified as *TPH (Calculated as).

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

* Reportable Detection Limit BRL = Below Reporting Limit

Notes and Definitions

*TPH	Calculated as
Comp	Completed
FP	Field Preserved
QB2	The method blank contains analyte at a concentration above the MRL, however no reportable concentration is present in the sample.
QC1	Analyte out of acceptance range.
QC2	Analyte out of acceptance range in QC spike but no reportable concentration present in sample.
QC3	The spike recovery is outside acceptable limits for the LCS. The batch was accepted based upon the MS and/or MSD meeting the LCS limits criteria.
QM4	Visual evaluation of the sample indicates the RPD is above the control limit due to a non-homogeneous sample matrix.
QM4X	The spike recovery was outside of QC acceptance limits for the MS, MSD and/or PS due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
QM7	The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QR4	Analyses are not controlled on RPD values from sample concentrations less than the reporting limit. QC batch accepted based on LCS and/or LCSD QC results
QR5	RPD out of acceptance range.
R01	The Reporting Limit for this analyte has been raised to account for matrix interference.
S02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
vex2	Field extracted
VOC8	Reporting limits reflect SW846 5030 extraction technique due to matrix interference using SW846 5035A extraction technique.
BRL	Below Reporting Limit - Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
NR	Not Reported
RPD	Relative Percent Difference
J	Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).

A plus sign (+) in the Method Reference column indicates the method is not accredited by NELAC.

This laboratory report is not valid without an authorized signature on the cover page.

Interpretation of Total Petroleum Hydrocarbon Report

Petroleum identification is determined by comparing the GC fingerprint obtained from the sample with a library of GC fingerprints obtained from analyses of various petroleum products. Possible match categories are as follows:

- Gasoline - includes regular, unleaded, premium, etc.
- Fuel Oil #2 - includes home heating oil, #2 fuel oil, and diesel
- Fuel Oil #4 - includes #4 fuel oil
- Fuel Oil #6 - includes #6 fuel oil and bunker "C" oil
- Motor Oil - includes virgin, waste automobile oil and hydraulic oil
- Ligroin - includes mineral spirits, petroleum naphtha, vm&p naphtha
- Aviation Fuel - includes kerosene, Jet A and JP-4
- Other Oil - includes lubricating and cutting oil, and silicon oil

At times, the unidentified petroleum product is quantified using a calibration that most closely approximates the distribution of compounds in the sample. When this occurs, the result is qualified as *TPH (Calculated as).

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

* Reportable Detection Limit BRL = Below Reporting Limit

Notes and Definitions

- *TPH Calculated as
- Comp Completed
- FP Field Preserved
- QB2 The method blank contains analyte at a concentration above the MRL, however no reportable concentration is present in the sample.
- QC1 Analyte out of acceptance range.
- QC2 Analyte out of acceptance range in QC spike but no reportable concentration present in sample.
- QC3 The spike recovery is outside acceptable limits for the LCS. The batch was accepted based upon the MS and/or MSD meeting the LCS limits criteria.
- QM4X The spike recovery was outside of QC acceptance limits for the MS, MSD and/or PS due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
- QM7 The spike recovery was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
- QR1 Analyses are not controlled on RPD values from sample concentrations less than 10 times the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.
- QR2 The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on percent recoveries and completeness of QC data.
- QR4 Analyses are not controlled on RPD values from sample concentrations less than the reporting limit. QC batch accepted based on LCS and/or LCSD QC results
- QR6 The RPD exceeded the QC control limits; however precision is demonstrated with acceptable RPD values for MS/MSD.
- R01 The Reporting Limit for this analyte has been raised to account for matrix interference.
- R05 Elevated Reporting Limits due to the presence of high levels of non-target analytes.
- S02 The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
- vex2 Field extracted
- VOC6 The production of Acetone and other ketones is commonly seen when using the SW 846 5035A extraction technique.
- VOC8 Reporting limits reflect SW846 5030 extraction technique due to matrix interference using SW846 5035A extraction technique.
- BRL Below Reporting Limit - Analyte NOT DETECTED at or above the reporting limit
- dry Sample results reported on a dry weight basis
- NR Not Reported
- RPD Relative Percent Difference
- J Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).

A plus sign (+) in the Method Reference column indicates the method is not accredited by NELAC.

This laboratory report is not valid without an authorized signature on the cover page.

Page 114 of 116

Interpretation of Total Petroleum Hydrocarbon Report

Petroleum identification is determined by comparing the GC fingerprint obtained from the sample with a library of GC fingerprints obtained from analyses of various petroleum products. Possible match categories are as follows:

- Gasoline - includes regular, unleaded, premium, etc.
- Fuel Oil #2 - includes home heating oil, #2 fuel oil, and diesel
- Fuel Oil #4 - includes #4 fuel oil
- Fuel Oil #6 - includes #6 fuel oil and bunker "C" oil
- Motor Oil - includes virgin, waste automobile oil and hydraulic oil
- Ligroin - includes mineral spirits, petroleum naphtha, vm&p naphtha
- Aviation Fuel - includes kerosene, Jet A and JP-4
- Other Oil - includes lubricating and cutting oil, and silicon oil

At times, the unidentified petroleum product is quantified using a calibration that most closely approximates the distribution of compounds in the sample. When this occurs, the result is qualified as *TPH (Calculated as).

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

Notes and Definitions

*TPH	Calculated as
Comp	Completed
FP	Field Preserved
QC1	Analyte out of acceptance range.
QC2	Analyte out of acceptance range in QC spike but no reportable concentration present in sample.
QC3	The spike recovery is outside acceptable limits for the LCS. The batch was accepted based upon the MS and/or MSD meeting the LCS limits criteria.
QM4X	The spike recovery was outside of QC acceptance limits for the MS, MSD and/or PS due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
QM8	The spike recovery exceeded the QC control limits for the MS and/or MSD. The batch was accepted based upon acceptable PS and/or LCS recovery.
QR1	Analyses are not controlled on RPD values from sample concentrations less than 10 times the reporting limit. QC batch accepted based on LCS and/or LCSD QC results.
QR2	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on percent recoveries and completeness of QC data.
QR4	Analyses are not controlled on RPD values from sample concentrations less than the reporting limit. QC batch accepted based on LCS and/or LCSD QC results
QR6	The RPD exceeded the QC control limits; however precision is demonstrated with acceptable RPD values for MS/MSD.
vex2	Field extracted
VOC8	Reporting limits reflect SW846 5030 extraction technique due to matrix interference using SW846 5035A extraction technique.
BRL	Below Reporting Limit - Analyte NOT DETECTED at or above the reporting limit
dry	Sample results reported on a dry weight basis
NR	Not Reported
RPD	Relative Percent Difference
J	Detected but below the Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).

A plus sign (+) in the Method Reference column indicates the method is not accredited by NELAC.

Interpretation of Total Petroleum Hydrocarbon Report

Petroleum identification is determined by comparing the GC fingerprint obtained from the sample with a library of GC fingerprints obtained from analyses of various petroleum products. Possible match categories are as follows:

- Gasoline - includes regular, unleaded, premium, etc.
- Fuel Oil #2 - includes home heating oil, #2 fuel oil, and diesel
- Fuel Oil #4 - includes #4 fuel oil
- Fuel Oil #6 - includes #6 fuel oil and bunker "C" oil
- Motor Oil - includes virgin, waste automobile oil and hydraulic oil
- Ligroin - includes mineral spirits, petroleum naphtha, vm&p naphtha
- Aviation Fuel - includes kerosene, Jet A and JP-4
- Other Oil - includes lubricating and cutting oil, and silicon oil

At times, the unidentified petroleum product is quantified using a calibration that most closely approximates the distribution of compounds in the sample. When this occurs, the result is qualified as *TPH (Calculated as).

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

Sample Matrices: Aqueous Soil/Sediment	

A	Were all samples received by the laboratory in a condition consistent with that described on the Chain of Custody documentation for the data set?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
B	Were all QA/QC procedures required for the specified analytical method(s) included in this report followed?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
C	Were all QC performance standards and recommendations for the specified methods achieved?	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No
D	Were results for all analyte-list compounds/elements for the specified method(s) reported?	<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No *

* The compounds and/or elements reported are as specifically requested by the client on the Chain of Custody and in some cases may not include the full analyte list as defined in the method.

Negative responses for A, B and C are addressed in a case narrative on the cover page of this report.

I, the undersigned, attest under the pains and penalties of perjury that, based upon my personal inquiry of those responsible for obtaining the information, the material contained in this analytical report is, to the best of my knowledge and belief, accurate and complete.

Hanibal C. Tayeh, Ph.D.
